Table of Contents

Document Revision History **2**
Table of Contents **3**
Preface **11**
1 System Overview **12**
1.1 Highlighted Features Integrated in MT6735 12
1.2 Platform Features 14
1.3 MODEM Features 16
1.4 Connectivity Features 18
1.5 Multimedia Features 20
1.6 General Description 22
2 Product Description **24**
2.1 Pin Description 24
2.2 Electrical Characteristic 62
2.3 System Configuration 70
2.4 Power-on Sequence 71
2.5 Analog Baseband 72
2.6 Package Information 92
2.7 Ordering Information 93
3 MCU and BUS Fabric **94**
3.1 MCU System 94
3.2 On-chip Memory Controller 109
3.3 External Interrupt Controller 116
3.4 System Interrupt Controller 181
3.5 Infrastructure System Configuration Module 203
3.6 External Memory Interface 263
3.7 DRAM Controller 363
3.8 AP_DMA 464
3.9 CQDMA 614
4 Clock and Power Control **635**
4.1 Top Clock Generator 635
4.2 Top Reset Generate Unit 672
4.3 PMIC Wrapper 686
4.4 Frequency Hopping Controller 739
5 Peripherals **773**
5.1 Pericfg Controller 773
5.2 GPIO Control 814
5.3 Keypad Scanner 937
5.4 UART 947
5.5 USB 2.0 High Speed Dual-Role Controller 966
5.6 USBPHY Register File 1025
5.7 SPI Interface Controller 1049

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

5.8 MSDC Controller 1058
5.9 AUXADC 1212
5.10 I2C/SCCB Controller 1228
5.11 Pulse-Width Modulation (PWM) 1242
5.12 General-Purpose Timer (GPT) 1280
5.13 Thermal Controller 1296
5.14 IRTX 1332
5.15 IrDA 1341
5.16 Audio System 1355
6 Multimedia Subsystem 1459
6.1 Multimedia Subsystem 1459
6.2 SMI_COMMON 1490
6.3 SMI_LARB 1513
6.4 CAM 1552
6.5 SENINF_TOP (Sensor Interface) 1989
6.6 FDVT 2140
6.7 MDP_RDMA 2191
6.8 MDP RSZ 2232
6.9 MDP ROT_DMA (Multimedia Data Path-Rotation DMA) 2248
6.10 Display 2D Sharpness 2278
6.11 DISP_OVL 2312
6.12 DISP RDMA (Display Read Direct Memory Access) 2372
6.13 DISP_WDMA 2388
6.14 Color Processor 2416
6.15 DISP CCORR (Display Color Correction Engine) 2457
6.16 DISP AAL (Display Adaptive Ambient Light Controller) 2465
6.17 DISP GAMMA (Display GAMMA Processing Engine) 2493
6.18 DISP Dither 2499
6.19 DISPLAY PWM Generator 2510
6.20 DPI (Digital Parallel Interface) 2515
6.21 Display Serial Interface 2543
6.22 MIPI TX Configuration Module 2593
6.23 JPEG Encoder 2617
6.24 JPEG Decoder 2632
6.25 Video Decoder 2657
6.26 H.264 Video Encoder 2683
6.27 MFG 2686
6.28 Multimedia Memory Management Unit (M4U) 2702
7 Analog Baseband 2711
7.1 AP Mixedsys 2711

Preface

Acronyms for register types

R/W	For both read and write access
RO	Read only
RC	Read only. After the register bank is read, every bit that is HIGH(1) will be cleared to LOW(0) automatically.
WO	Write only
W1S	Write only. When data bits are written to the register bank, every bit that is HIGH(1) will cause the corresponding bit to be set to 1. Data bits that are LOW(0) have no effects on the corresponding bit.
W1C	Write only. When data bits are written to the register bank, every bit that is HIGH(1) will cause the corresponding bit to be cleared to 0. Data bits that are LOW(0) have no effects on the corresponding bit.

1 System Overview

The MT6735 device (see Figure 1-1), with integrated Bluetooth, FM, WLAN and GPS modules, is a highly integrated baseband platform incorporating both modem and application processing subsystems to enable LTE smart phone applications,. The chip integrates Quad-core ARM® Cortex-A53 operating up to 1.3GHz, an ARM® Cortex-R4 MCU and powerful multi-standard video codec. In addition, an extensive set of interfaces and connectivity peripherals are included to interface to cameras, touch-screen displays and MMC/SD cards.

The application processor, an Quad-core ARM® Cortex-A53 MPCore™ equipped with NEON engine offers processing power necessary to support the latest OpenOS along with its demanding applications such as web browsing, email, GPS navigation and games.
All are viewed on a high resolution touch screen display with graphics enhanced by the 2D and 3D graphics acceleration.

The multi-standard video accelerator and an advanced audio subsystem are also integrated to provide advanced multimedia applications and services such as streaming audio and video, a multitude of decoders and encoders.

An ARM® Cortex-R4, DSP, and 2G and 3G coprocessors combined provide a powerful modem subsystem capable of supporting LTE Cat 4, Category 24 HSDPA downlink and Category 7 HSUPA uplink data rates, Category 14 TD-HSDPA downlink and Category 6 TD-HSUPA uplink, as well as Class 12 GPRS, EDGE. Supports cdma2000 HRPD/1xEV-DO Revision 0 and A (3.1Mbps for forward link and 1.8Mbps for reverse link).

MT6735 also embodies wireless communication device, including WLAN, Bluetooth and GPS. With four advanced radio technologies integrated into one single chip, MT6735 provides the best and most convenient connectivity solution in the industry.

The enhanced overall quality is achieved for simultaneous voice, data and audio/video transmission on mobile phones and Media Tablets. The small footprint with low-power consumption greatly reduces the PCB layout resource.

1.1 Highlighted Features Integrated in MT6735

- Quad-core ARM® Cortex-A53 MPCore™ operating at 1.3GHz
- LPDDR3 up to 3GB, 640MHz
- LTE Cat 4 (150Mnps)
- CDMA200 HEPD/ 1xEV-DO Revision 0 and A.
- Embedded connectivity system including WLAN/BT/FM/GPS
- Resolution up to HD (1,280*720)
- OpenGL ES 3.0 3D graphic accelerator
- ISP supports 13MP@30fps.
- H.264 1080p @ 30fps encoder
- Speech codec (FR, HR, EFR, AMR FR, AMR HR and Wide-Band AMR)

1.2 Platform Features

- **General**
  - Smartphone, two MCU subsystems architecture
  - eMMC boot support
  - Supports LPDDR-2/LPDDR-3

- **AP MCU subsystem**
  - Quad-core ARM® 1.3Ghz Cortex-A53 MPCore™
  - NEON multimedia processing engine with SIMDv2/VFPv4 ISA support
  - 32KB L1 I-cache and 32KB L1 D-cache
  - 512KB unified L2 cache
  - DVFS technology with adaptive operating voltage from 0.85V to 1.25V

- **MD MCU subsystem**
  - ARM® Cortex-R4 processor with max. 600MHz operation frequency
  - 64KB I-cache, 64KB D-cache
  - 512KB TCM (tightly-coupled memory)
  - Coresonic DSP for running LTE modem tasks, with max. 240MHz operation frequency
  - FD216 DSP for running modem/voice tasks, with max. 250MHz operation frequency
  - High-performance AXI and AHB bus
  - General DMA engine and dedicated DMA channels for peripheral data transfer
  - Watchdog timer for system error recovery
  - Power management for clock gating control

- **MD external interfaces**
  - Dual SIM/USIM interface
  - Interface pins with RF and radio-related peripherals (antenna tuner, PA, etc.)

- **Security**
  - ARM® TrustZone® Security

- **External memory interface**
  - LPDDR2/3 up to 3GB
  - Single channel with 32-bit data bus width
  - Memory clock up to 640MHz
  - Self-refresh/partial self-refresh mode
  - Low-power operation
  - Programmable slew rate for memory controller's IO pads
  - Dual rank memory device
  - Advanced bandwidth arbitration control

- **Peripherals**
  - USB2.0 HS/FS support
  - eMMC5.1
  - 4 UART for debugging and applications
  - SPI master for external device
  - 4 I2C to control peripheral devices, e.g. CMOS image sensor, LCM or FM receiver module
  - Max. 5 PWM channels (depending on system configuration/IO usage)
  - I2S for connection with optional external hi-end audio codec
  - GPIOs
  - 3 sets of memory card controllers supporting SD/SDHC/MS/MSPRO/MMC and SDIO2.0/3.0 protocols

- **Operating conditions**
  - Core voltage: 1.15V
  - I/O voltage: 1.8V/2.8V/3.3V
  - Memory: 1.2V
  - LCM interface: 1.8V
  - Clock source: 26MHz, 32.768kHz

- **Package**
  - Type: VFBGA
  - 12.6mm*12.6mm

1.3 MODEM Features

- **LTE**
  - FDD: Up to 150Mbps downlink, 50Mbps uplink
  - TDD: Up to 150Mbps downlink, 50Mbps uplink
  - 1.4 to 20MHz RF bandwidth
  - 2*2 downlink SU-MIMO; 4*2 downlink SU-MIMO
  - IPv6, QoS
  - Inter-RAT capabilities with HSPA+, EDGE and applicable backward-compatible modes
  - SNOW3G/ZUC cipher offload engine
- **3G UMTS FDD supported features**
  - 3G modem supports most main features in 3GPP Release 7 and Release 8
  - CPC (DTX in CELL_DCH, UL DRX DL DRX), HS-SCCH-less, HS-DSCH
  - Dual cell operation
  - MAC-ehs
  - 2 DRX (receiver diversity) schemes in URA_PCH and CELL_PCH
  - Uplink Cat. 7 (16QAM), throughput up to 11.5Mbps
  - Downlink Cat. 24 (64QAM, dual-cell HSDPA), throughput up to 42.2Mbps
  - Fast dormancy
  - ETWS
  - Network selection enhancements
- **TD-SCDMA**
  - CDMA/HSDPA/HSUPA baseband
  - TD-SCDMA Bands 34, 39 & 40 and Quad band GSM/EDGE
  - Circuit-switched voice and data; packet-switched data
  - 384/384Kbps class in UL/DL for TD-SCDMA
  - TD-HSDPA: 2.8Mbps DL (Cat.14)
  - TD-HSUPA: 2.2Mbps UL (Cat.6)
  - F8/F9 ciphering/integrity protection
- **Radio interface and baseband front-end**
  - High dynamic range delta-sigma ADC converts the downlink analog I and Q signals to digital baseband.
  - 10-bit D/A converter for Automatic Power Control (APC)
  - Programmable radio Rx filter with adaptive gain control
  - Dedicated Rx filter for FB acquisition
  - Baseband Parallel Interface (BPI) with programmable driving strength
  - Supports multi-band
- **GSM modem and voice CODEC**
  - Dial tone generation
  - Noise reduction
  - Echo suppression
  - Advanced side-tone oscillation reduction
  - Digital side-tone generator with programmable gain
  - 2 programmable acoustic compensation filters
  - GSM quad vocoders for adaptive multi-rate (AMR), enhanced full rate (EFR), full rate (FR) and half rate (HR)
  - GSM channel coding, equalization and A5/1, A5/2 and A5/3 ciphering
  - GPRS GEA1, GEA2 and GEA3 ciphering
  - Programmable GSM/GPRS/EDGE modem
  - Packet switched data with CS1/CS2/CS3/CS4 coding schemes
  - GSM circuit switch data
  - GPRS/EDGE Class 12
  - Supports SAIC (Single Antenna Interference Cancellation) technology
  - VAMOS (Voice services over Adaptive Multi-user channels on One Slot) technology in R9 spec

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

- **CDMA2000**
  - Supports cmda2000 1xRTT (release 1 and Advanced) and cdma2000 HRPD/1xEV-DO Revision 1 and A.
  - Hybrid operation between 1x and HEPD
  - Simultaneous hybrid dual receiver (SHDR) support.
  - Supports maximum 1x data rates of 153.6kbps for forward and reverse links and DO data rates of 3.1Mbps for forward link and 1.8Mbps for reverse link.
  - Supports 1x Diversity.

1.4 Connectivity Features

MT6735 includes four wireless connectivity functions:

- WLAN
- Bluetooth
- GPS
- FM Receiver

The RF parts of those four blocks are placed on chip MT6625. With four advanced radio technologies integrated on one chip, MT6735/MT6625 is the best and most convenient connectivity solution in the industry,MT6735 implementing advanced and sophisticated Radio Coexistence algorithms and hardware mechanisms. It supports single antenna sharing among 2.4 GHz Bluetooth, 2.4GHz/5GHz WLAN and 1.575 GHz for GPS. The enhanced overall quality is achieved for simultaneous voice, data and audio/video transmission on mobile phones and Media Tablets. The small footprint with low-power consumption greatly reduces PCB layout resource. MT6735 also supports 802.11ac WLAN in advanced assorted with MT6630.

- **Supports integrated WIFI/BlueTooth/GPS**
  - Single antenna for Bluetooth and WLAN/GPS/Bluetooth
  - Self calibration
  - Single TCXO and TMS for GPS, BT and WLAN
  - Best-in-class current consumption performance
  - Intelligent BT/WLAN coexistence scheme that goes beyond PTA signaling (e.g. transmit window and duration that take into account protocol exchange sequence, frequency, etc.)
- **Wi-Fi**
  - Dual-band (2.4GHz/5Ghz) single stream 802.11 a/b/g/n MAC/BB/RF
  - 802.11 d/h/k compliant
  - Security: WFA WPA/WPA2 personal, WPS2.0, WAPI (hardware)
  - QoS: WFA WMM, WMM PS
  - 802.11n optional features: STBC, A-MPDU, Blk-Ack, RIFS, MCS Feedback, 20/40MHz coexistence (PCO), unscheduled PSMP
  - Supports 802.11w protected managed frames
  - Supports Wi-Fi Direct (WFA P-2-P standard) and Wi-Fi Miracast (Wi-Fi Display)
  - Supports Wi-Fi HotSpot 2.0
  - Integrated 2.4GHz PA with max. 19dBm CCK output power and 5GHz PA with max. 17dBm OFDM 54Mbps output power
  - Typical Rx sensitivity with companion chip modem: -75dBm at 11g 54Mbps mode and -75.5dBm at 11a 54Mbps mode
  - Per packet TX power control
- **BlueTooth**
  - Bluetooth specification v2.1+EDR
  - Bluetooth specification 3.0+HS compliance
  - Bluetooth v4.0 Low Energy (LE)
  - Integrated PA with 6dBm (class 1) transmit power
  - Typical Rx sensitivity with companion chip modem: GFSK -92.5dBm, DQPSK -91.5dBm, 8-DPSK -86dBm
  - Best-in-class BT/Wi-Fi coexistence performance
  - Up to 4 piconets simultaneously with background inquiry/page scan
  - Supports Scatternet

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

- Packet Loss Concealment (PLC) function for better voice quality
- Low-power scan function to reduce power consumption in scan modes

- **GPS**
  - GPS/Glonass/Beidou/Galileo/ QZSS tri-band reception concurrently
  - Supports SBAS (Satellite-Based Augmentation Systems): WAAS/MSAS/EGNOS/GAGAN
  - Best-in-class sensitivity performance
    - -165 dBm tracking sensitivity
    - -163 dBm hot start sensitivity
    - -148 dBm cold start sensitivity
    - -151 dBm warm start sensitivity
  - AGPS sensitivity is 6dB design margin over 3GPP
  - Full A-GPS capability (E911/SUPL/EPO/HotStill)
  - Active interference cancellation for up to 12 in-band tones
  - Supports both TCXO and TMS (Thermister Crystal) clock source
  - 5Hz update rate

- **FM**
  - 65-108MHz with 50kHz step
  - RDS/RBDS
  - Digital stereo demodulator
  - Simplified digital audio interface (I2S)
  - Stereo noise reduction
  - Audio sensitivity 2dBµVemf (SINAD=26dB)
  - Audio SINAD 60dB
  - Anti-jamming
  - Integrated short antenna

- **WBT IPD**
  - Integrated matching network, balance band-pass filter, GPS-WBT diplexer
  - Fully integrated in one IPD die
  - Single and dual antenna operation

- **GPS IPD**
  - Integrated high-pass type matching network and 5th-order ellipse low-pass filter
  - Fully integrated in one IPD die
  - Single and dual antenna operation

MEDIATEK CONFIDENTIAL

1.5 Multimedia Features

- **Display**
  - Portrait panel resolution up to HD (1,280*720)
  - MIPI DSI interface (4 data lanes)
  - MiraVision™ for picture quality enhancement
  - ClearMotionTM for DTV-class video quality
  - Embedded LCD gamma correction
  - True colors
  - 4 overlay layers with per-pixel alpha channel and gamma table
  - Single and dual antenna operation, spatial and temporal dithering
  - Side-by-side format output to stereo 3D panel in both portrait and landscape modes
  - Color enhancement
  - Adaptive contrast enhancement
  - Image/video/graphic sharpness enhancement
  - Dynamic backlight scaling
  - Wide gamut

- **Graphics**
  - 3D graphic accelerator capable of processing 100M tri/sec and 900M pixel/sec @ 450 MHz
  - Support API standards OpenGL ES 1.1/2.0/3.0, OpenCL 1.0/1.1/1.2 and DirectX9

- **Image**
  - Integrated image signal processor supports 13MP@30fps.
  - Electronic image stabilization
  - Video stabilization
  - Preference color adjustment
  - Noise reduction
  - Multiple frame noise reduction for image capture
  - Temporal noise reduction for video recording
  - Lens shading correction
  - Auto sensor defect pixel correction
  - Supports AE/AWB/AF
  - Edge enhancement (sharpness)
  - Face detection and visual tracking
  - Video face beautification
  - Zero shutter delay image capture
  - Captures full size image when recording video (up to 13M sensors)
  - 2 MIPI CSI-2 high-speed camera serial interfaces; both are 4 data lane
  - PIP (picture in picture), [13MP + 5MP]@15fps
  - Hardware JPEG encoder: Baseline encoding with 130M pixel/sec. Continuous shot with 96M pixel/sec
  - Supports YUV422/YUV420 color format and EXIF/JFIF format

- **Video**
  - H.264 decoder: Baseline 1080p @ 30fps/40Mbps
  - H.264 decoder: Main/high profile 1080p @30fps/40Mbps
  - Sorenson H.263/H.263 decoder: 1080p @ 30fps/40Mbps
  - MPEG-4 SP/ASP decoder: 1080p @ 30fps/40Mbps
  - DIVX4/DIVX5/DIVX6/DIVX HD/XVID decoder: 1080p @ 30fps/40Mbps
  - H.264 encoder: High profile 1080p @ 30fps

- **Audio**
  - Audio content sampling rates supported: 8kHz to 192kHz
  - Audio content sample formats supported: 8-bit/16-bit/24-bit, Mono/Stereo
  - Interfaces supported: I2S, PCM

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

- External CODEC I2S interface supports 16-bit/24-bit, Mono/Stereo, 8kHz to 192kHz.
- 4-band IIR compensation filter to enhance loudspeaker responses
- Proprietary audio post-processing technologies: BesLoudness(MB-DRC), BesSurround, Android built-in post processing
- Audio encoding: AMR-NB, AMR-WB, AAC, OGG, ADPCM
- Audio decoding: WAV, MP3, MP2, AAC, AMR-NB, AMR-WB, MIDI, Vorbis, APE, AAC-plus v1, AAC-plus v2, FLAC, WMA, ADPCM

- **Speech**
  - Speech codec (FR, HR, EFR, AMR FR, AMR HR and Wide-Band AMR)
  - CTM
  - Noise reduction
  - Noise suppression
  - Noise cancellation
  - Dual-MIC noise cancellation
  - Echo cancellation
  - Echo suppression
  - Dual-MIC voice tracking
  - Dual-MIC sound recording w/o Wind Noise Rejection
  - MagiLoudness (enhances the voice clarity based on near end environment noise)
  - MagiClarity (maximizes loudness while controlling the maximum receiver output power; feed-forward receiver protection)
  - Compensation filter and digital gain for both uplink and downlink paths

1.6 General Description

MediaTek's MT6735 is a highly integrated LTE System-on-Chip (SoC) which incorporates advanced features, e.g. LTE cat.4, Octa HMP core operating at 1.3GHz, 3D graphics (OpenGL|ES 3.0), 13M camera ISP, LPDDR3-640 Mbps, HD display and 1080p video codec. MT6735 helps phone manufacturers build high-performance LTE smart phones with PC-like browser, 3D gaming and cinema class home entertainment experiences.

The World-leading Technology!

Based on MediaTek's world-leading mobile chip SoC architecture with advanced 28nm process, MT6735 is the brand-new generation smart phone SoC integrating MediaTek LTE modem, Quad-core ARM® Cortex-A53 MPCore™, 3D graphics and high-definition 1080p video decoder.

Rich in Features, High-value Product!

To enrich camera features, MT6735 equips a 13M camera ISP with advanced features, e.g. auto focus, electrical stabilization, auto sensor defect pixel correction, continuous video AF, face detection, face beautify, burst shot, optical zoom, panorama view, picture in picture, video in video and video face beautication.

Incredible Browser Experience!

The powerful CPU architecture with NEON multimedia processing engine brings PC-like browser experiences while keeping low standby power. GPU supporting OpenGL|ES 3.0 also provides you with excellent multimedia experiences.

2.1.3 Detailed Pin Description

Table 2-2. Acronym for pin type

Abbreviation	Description
AI	Analog input
AO	Analog output
AIO	Analog bi-direction
DI	Digital input
DO	Digital output
DIO	Digital bi-direction
P	Power
G	Ground

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Table 2-3. Detailed pin description (using LPDDR3)

Pin name	Type	Description	Power domain
SYSTEM			
SYSRSTB	DI	System reset input	DVDD18_IORB
WATCHDOG	DO	Watchdog reset output	DVDD18_IORB
TESTMODE	DIO	Test mode	DVDD18_IOLB
RTC32K_CK	DIO	32K clock input	DVDD18_IORB
SRCLKENAI	DIO	26MHz co-clock enable input	DVDD18_IOLB
SRCLKENA0	DIO	26MHz co-clock enable output	DVDD18_IORB
SRCLKENA1	DIO	26MHz co-clock enable output	DVDD18_IOLB
PMIC			
PWRAP_SPI0_MO	DIO	PMIC SPI control interface	DVDD18_IORB
PWRAP_SPI0_MI	DIO	PMIC SPI control interface	DVDD18_IORB
PWRAP_SPI0_CSN	DIO	PMIC SPI control interface	DVDD18_IORB
PWRAP_SPI0_CK	DIO	PMIC SPI control interface	DVDD18_IORB
PWRAP_INT	DIO	PMIC SPI control interface	DVDD18_IORB
AUD_CLK_MOSI	DIO	PMIC audio input interface	DVDD18_IORB
AUD_DAT_MOSI	DIO	PMIC audio input interface	DVDD18_IORB
AUD_DAT_MISO	DIO	PMIC audio input interface	DVDD18_IORB
SIM			
SIM1_SIO	DIO	SIM1 data, PMIC interface	DVDD18_MC1
SIM1_SRST	DIO	SIM1 reset, PMIC interface	DVDD18_MC1
SIM1_SCLK	DIO	SIM1 clock, PMIC interface	DVDD18_MC1
SIM2_SIO	DIO	SIM2 data, PMIC interface	DVDD18_MC1
SIM2_SRST	DIO	SIM2 reset, PMIC interface	DVDD18_MC1
SIM2_SCLK	DIO	SIM2 clock, PMIC interface	DVDD18_MC1
JTAG			
JTCK	DIO	JTCK	DVDD18_IOLB
JTDO	DIO	JTDO	DVDD18_IOLB
JTDI	DIO	JTDI	DVDD18_IOLB
JTMS	DIO	JTMS	DVDD18_IOLB
LCD			
DISP_PWM	DIO	Display PWM output	DVDD18_IOLB
DSI_TE	DIO	Parallel display interface tearing effect	DVDD18_IORB
LCM_RST	DIO	Parallel display interface reset signal	DVDD18_IORB
I2S			
I2S_DATA_IN	DIO	I2S data input pin	DVDD18_IOLB
I2S_BCK	DIO	I2S clock	DVDD18_IOLB
I2S_LRCK	DIO	I2S word select	DVDD18_IOLB
PCM/I2S merge interface			
PCM_TX	DIO	PCM audio interface	DVDD18_IOLB
PCM_CLK	DIO	PCM audio interface	DVDD18_IOLB

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Pin name	Type	Description	Power domain
PCM_RX	DIO	PCM audio interface	DVDD18_IOLB
PCM_SYNC	DIO	PCM audio interface	DVDD18_IOLB
EINT			
EINT0	DIO	External interrupt 0	DVDD18_IOLB
EINT1	DIO	External interrupt 1	DVDD18_IOLB
EINT2	DIO	External interrupt 2	DVDD18_IOLB
EINT3	DIO	External interrupt 3	DVDD18_IOLB
EINT4	DIO	External interrupt 4	DVDD18_IOLB
EINT5	DIO	External interrupt 5	DVDD18_IOLB
EINT6	DIO	External interrupt 6	DVDD18_IOLB
EINT7	DIO	External interrupt 7	DVDD18_IOLB
EINT8	DIO	External interrupt 8	DVDD18_IOLB
EINT9	DIO	External interrupt 9	DVDD18_IOLB
EINT10	DIO	External interrupt 10	DVDD18_IOLB
EINT11	DIO	External interrupt 11	DVDD18_IOLB
EINT12	DIO	External interrupt 12	DVDD18_IOLB
UART			
URXD0	DIO	UART0 RX	DVDD18_IOLB
UTXD0	DIO	UART0 TX	DVDD18_IOLB
URXD1	DIO	UART1 RX	DVDD18_IOLB
UTXD1	DIO	UART1 TX	DVDD18_IOLB
URXD2	DIO	UART2 RX	DVDD18_IOLB
UTXD2	DIO	UART2 TX	DVDD18_IOLB
URXD3	DIO	UART3 RX	DVDD18_IOLB
UTXD3	DIO	UART3 TX	DVDD18_IOLB
SPI			
SPI_CS	DIO	SPI chip select	DVDD18_IOLB
SPI_MI	DIO	SPI data in	DVDD18_IOLB
SPI_MO	DIO	SPI data out	DVDD18_IOLB
SPI_CK	DIO	SPI clock	DVDD18_IOLB
BPI			
BPI_BUS0	DIO	BPI1 BUS0	DVDD18_IORB
BPI_BUS1	DIO	BPI1 BUS1	DVDD18_IORB
BPI_BUS2	DIO	BPI1 BUS2	DVDD18_IORB
BPI_BUS3	DIO	BPI1 BUS3	DVDD18_IORB
BPI_BUS4	DIO	BPI1 BUS4	DVDD18_IORB
BPI_BUS5	DIO	BPI1 BUS5	DVDD18_IOLB
BPI_BUS6	DIO	BPI1 BUS6	DVDD18_IOLB
BPI_BUS7	DIO	BPI1 BUS7	DVDD18_IOLB
BPI_BUS8	DIO	BPI1 BUS8	DVDD18_IOLB
BPI_BUS9	DIO	BPI1 BUS9	DVDD18_IOLB
BPI_BUS10	DIO	BPI1 BUS10	DVDD18_IOLB
BPI_BUS11	DIO	BPI1 BUS11	DVDD18_IOLB

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.

[1] The column "State" of "Reset" shows the pin state during reset (Input, High Output, Low Output, etc).
[2] The column "Aux" for "Reset" means the default aux. funtion number shown in Table "Pin Multiplexing, Capability and Settings".
[3] The column "PU/PD" for "Reset" means if there is internal pull-up or pull-down when the pin is input in the reset state.

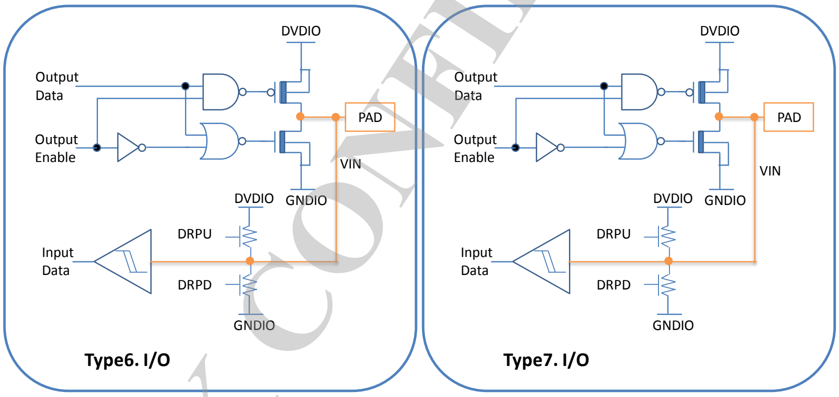
Type4. MSDC 1.8V I/O
(2mA, 4mA, 6mA, 8mA,
10mA, 12mA, 14mA, 16mA)

Type5. 3.3v GPIO
(4mA, 8mA, 12mA, 16mA)



Type6. MSDC 3.3V I/O
(2mA, 4mA, 6mA, 8mA,
10mA, 12mA, 14mA, 16mA)

Type7. 3.3v SIM I/O
(4mA, 8mA, 12mA, 16mA)

Figure 2-3. IO types in state of pins

2.1.4 Pin Multiplexing, Capability and Settings

Table 2-6. Acronym for pull-up and pull-down type

Abbreviation	Description
PU	Pull-up, not controllable
PD	Pull-down, not controllable
CU	Pull-up, controllable
CD	Pull-down, controllable
X	Cannot pull-up or pull-dowm

MEDIATEK CONFIDENTIAL

2.2 Electrical Characteristic

2.2.1 Absolute Maximum Ratings

Table 2-8. Absolute maximum ratings for power supply

Symbol or pin name	Description	Min.	Max.	Unit
AVDD18_PLLGP AVDD18_MEMPLL AVDD18_MDPLLGP	Analog power input 1.8V for PLL	1.7	1.9	V
AVDD18_AP	Analog power input 1.8V for AuxADC, TSENSE	1.7	1.9	V
AVDD18_MD	Analog power input 1.8V for BBTX, BBRX	1.7	1.9	V
AVDD28_DAC	Analog power input 2.8V for APC	2.66	2.94	V
DVDD18_MIPITX1	Analog power for MIPI DSI	1.7	1.9	V
DVDD18_MIPIRX- DVDD18_MIPIRX1	Analog power for MIPI CSI- & CSI1	1.7	1.9	V
AVDD33_USB_P- AVDD33_USB_P1	Analog power 3.3V for USB	3.135	3.465	V
AVDD18_USB	Analog power 1.8V for USB	1.7	1.9	V
AVDD18_WBG	Analog power 1.8V for connectivity ABB	1.7	1.9	V
DVDD18_IO! DVDD18_IO2 DVDD18_IO3 DVDD18_BIAS1 DVDD18_BIAS2 DVDD18_BIAS3	Digital power input for 1.8V IO	1.62	1.98	V
DVDD28_BPI1 DVDD28_BPI2	Digital power input for BPI	1.7	3.6	V
DVDD18_MSDC-	Digital power input for MSDC-	1.62	1.98	V
DVDD28_MSDC1	Digital power input for MSDC1	1.7	3.6	V
DVDD28_SIM1	Digital power input for SIM1	1.7	3.6	V
DVDD28_SIM2	Digital power input for SIM2	1.7	3.6	V
DDRV DDRV_CLK DDRV_VREF	Digital power input for DRAM	1.14	1.3	V
DVDD_DVFS	Digital power input for DVFS	-.72	1.131	V
DVDD_GPU	Digital power input for GPU	-.93	1.125	V
DVDD_LTE	Digital power input for LTE	-.9	1.1	V
DVDD_SRAM	Digital power input for SRAM	-.93	1.131	V
DVDD_TOP	Digital power input for TOP	-.63	1.125	V

Warning: *Stressing the device beyond the absolute maximum ratings may cause permanent damage. These are stress ratings only.*

MEDIATEK CONFIDENTIAL

2.2.2 Recommended Operating Conditions

Table 2-9. Recommended operating conditions for power supply

Symbol or pin name	Description	Min.	Typ.	Max.	Unit
AVDD18_PLLGP AVDD18_MEMPLL AVDD18_MDPLLGP	Analog power input 1.8V for PLL	1.7	1.8	1.89	V
AVDD18_AP	Analog power input 1.8V for AuxADC, TSENSE	1.71	1.8	1.89	V
AVDD18_MD	Analog power input 1.8V for BBTX, BBRX	1.71	1.8	1.89	V
AVDD28_DAC	Analog power input 2.8V for APC	2.66	2.8	2.94	V
DVDD18_MIPITX1	Analog power for MIPI DSI	1.71	1.8	1.89	V
AVDD33_USB_P- AVDD33_USB_P1	Analog power for MIPI CSI- & CSI1	1.71	1.8	1.89	V
AVDD33_USB	Analog power 3.3V for USB	3.135	3.3	3.465	V
AVDD18_USB	Analog power 1.8V for USB	1.71	1.8	1.89	V
AVDD18_WBG	Analog power 1.8V for connectivity ABB	1.71	1.8	1.89	V
DVDD28_BPI1 DVDD28_BPI2	Digital power input for BPI	1.7	1.8	1.95	V
		2.66	2.8	2.94	
DVDD18_IO! DVDD18_IO2 DVDD18_IO3 DVDD18_BIAS1 DVDD18_BIAS2 DVDD18_BIAS3	Digital power input for 1.8V IO	1.62	1.8	1.98	V
DVDD18_MSDC-	Digital power input for MSDC-	1.62	1.8	1.98	V
DVDD28_MSDC1	Digital power input for MSDC1	1.7	1.8	1.95	V
		2.7	3.3	3.6	
DVDD28_SIM1 DVDD28_SIM2	Digital power input for SIM1/SIM2	2.7	3.3	3.6	V
		1.7	1.8	1.9	
DDRV DDRV_CLK DDRV_VREF	Digital power input for EMI (LPDDR2/3)	1.14	1.2	1.3	V
DVDD_DVFS	Digital power input for DVFS	-.72	1.-	1.131	V
DVDD_GPU	Digital power input for GPU	-.93	1.-	1.125	V
DVDD_LTE	Digital power input for LTE	-.9	1.-	1.1	V
DVDD_SRAM	Digital power input for SRAM	-.93	1.-	1.131	V
DVDD_TOP	Digital power input for TOP	-.63	1.-	1.125	V

MEDIATEK CONFIDENTIAL

2.2.3 Storage Condition

1. Shelf life in sealed bag: 12 months at < 40°C and < 90% relative humidity (RH).
2. After the bag is opened, devices subjected to infrared reflow, vapor-phase reflow or equivalent processing must be:
   - Mounted within 168 hours in factory condition of 30°C/60% RH, or
   - Stored at 20% RH

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

3. Devices require baking before being mounted, if they are placed
   - For 192 hours at 40°C +5°C/-0°C and < 5% RH in low temperature device containers, or
   - For 24 hours at 125°C +5°C/-0°C in high temperature device containers.

2.2.4 AC Electrical Characteristics and Timing Diagram

2.2.4.1.1 External Memory Interface for LPDDR3

The external memory interface, shown in Figure 2-4. Basic timing parameter for LPDDR3 commands, Figure 2-5 and Figure 2-6, is used to connect LPDDR3 device for MT6735. It includes pins CLK_T, CLK_C, CKE[1:0], CS[1:0], DQS[3:0], DQS#[3:0], CA[9:0] and DQ[31:0]. Table 2-10 summarizes the symbol definition and the related timing specifications.

2.5 Analog Baseband

2.5.1 Introduction

To communicate with analog blocks, a common control interface for all analog blocks is implemented. In addition, there are some dedicated interfaces for data transfer. The common control interface translates the APB bus write and read cycle for specific addresses related to analog front-end control. In the write or read of any of these control registers, there is a latency associated with the transfer of data to or from the analog front-end. Dedicated data interface of each analog block is implemented in the corresponding digital block. An analog block includes the following analog functions for the complete GSM/GPRS/WCDMA/LTE/C2K base-band signal processing:

- Base-band Rx: For I/Q channels base-band A/D conversion
- Base-band Tx: For I/Q channels base-band D/A conversion and smoothing filtering
- ETDAC: A DAC output to control buck-converter for envelop tracking technique.
- RF control: Two DACs for automatic power control (APC) is included.The outputs are provided to external RF power amplifiers respectively.
- Auxiliary ADC: Provides an ADC for the battery and other auxiliary analog functions monitoring.
- Clock generation: One clock-squarer for shaping the input sinwave clock and 20 PLLs providing clock signals to base-band TRx, DSP, MCU, USB, MSDC units.

2.5.2 Features

The analog blocks include the following analog functions for complete GSM/GPRS/WCDMA/LTE/C2K base-band signal processing:

- LTE_BBRX
- C2K_BBRX
- LTE_BBTX
- C2K_BBTX
- ETDAC
- APC-DAC
- AUXADC
- Phase locked loop
- Temperature sensor

2.5.3 Block Diagram

2.5.3.1 LTE_BBRX

2.5.3.1.1 Block Descriptions

The receiver (Rx) performs baseband I/Q channels downlink analog-to-digital conversion:

1. Analog input multiplexer: For each channel, a 2-input multiplexer is included.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

2. A/D converter: 4 high performance sigma-delta ADCs perform I/Q digitization for further digital signal processing.

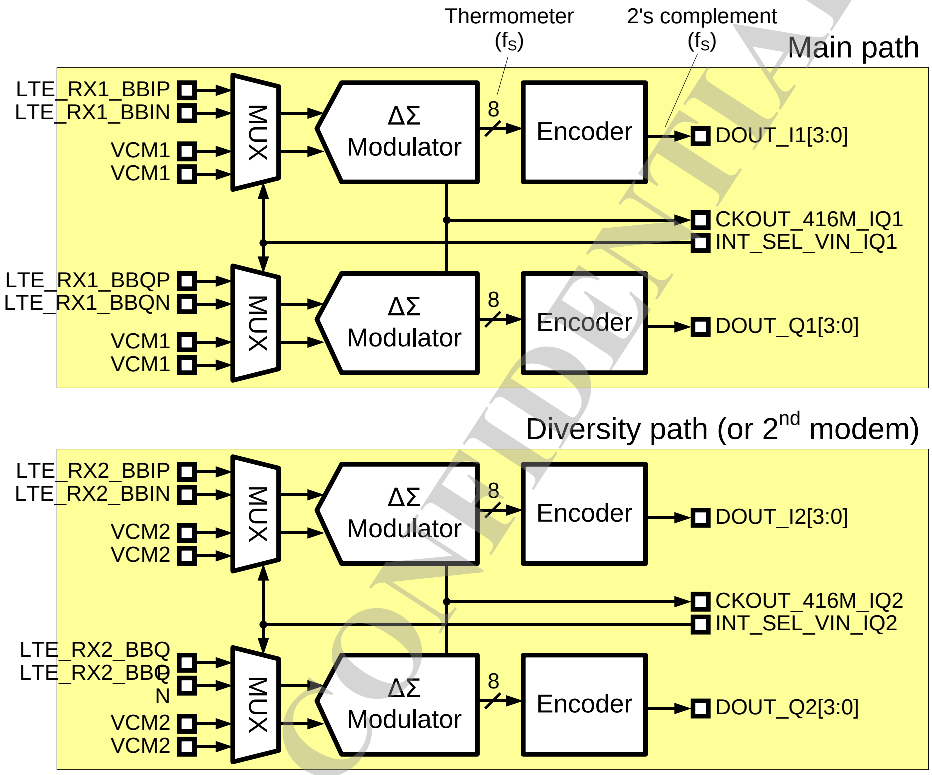

Figure 2-11. Block diagram of LTE_BBRX-ADC

2.5.3.1.2 Functional Specifications

See the table below for the functional specifications of the base-band downlink receiver.

Table 2-14. Baseband downlink specifications

Symbol	Parameter	Min.	Typ.	Max.	Unit

2.5.3.4 LTE_BBTX

2.5.3.4.1 Block Descriptions

BBTX includes two channel DACs with the 1st order low pass filter. The DACs are PMOS current-steering topology with NMOS constant sinking current and the active RC filter performs current to voltage buffer.

The bitwidth of DACs is 11-bit which is encoded into 7 bits of thermometer code and 8 binary code by digital hard macro inside BBTX layout. The encoded bits are timing synchronized by D-type flip-flop which is toggled by the analog local clock. The MD-PLL delivers 832MHz differential clock to BBTX. A clock divider translates the 832MHz to 416MHz for DACs and AFIFO inside mixedsys.

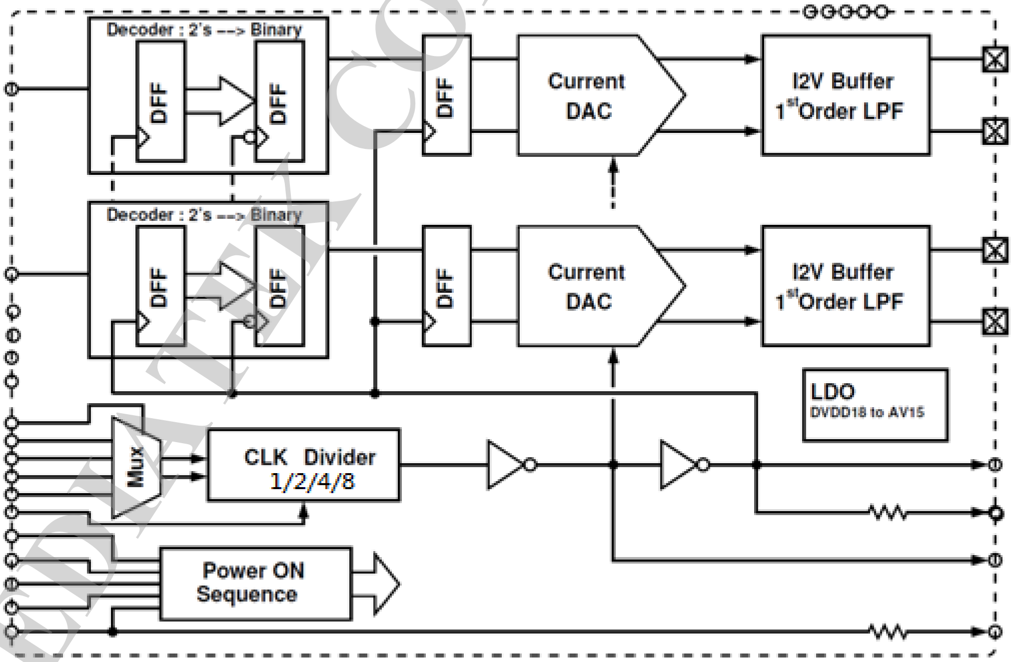

Figure 2-13. Block diagram of LTE_BBTX

2.5.3.4.2 Functional Specifications

2.5.3.5 C2K_BBTX

2.5.3.5.1 Block Descriptions

BBTX includes two channels of DACs with the first order low pass filter. The DACs are PMOS current-steering topology with NMOS constant sinking current, and the active RC filter performs current to the voltage buffer.

The bitwidth of DACs is 10-bit which is encoded into 7 bits of thermometer code and 7 binary code by mixedsys hardware. The encoded bits are timing synchronized by D-type flip-flop which is toggled by the analog local clock. MD-PLL2 deliver 393.216MHz differential clock to BBTX. A clock divider buffered the 393.216MHz to AFIFO inside the mixedsys.

The IO power, DVDD18_MD, is regulated to a voltage around 1.55V to supply analog component, and the required bias currents are generated by BBRX.

2.5.3.6 ETDAC

2.5.3.6.1 Block Descriptions

The ETDAC (Envelope Tracking DAC) provides analog envelope signal to external ET modulator. It includes:

1. 11-bit D/A converter: Converts digital modulated signals to analog domain. The input to the DAC is sampled at 416MHz rate with the 11-bit resolution.
2. Smoothing filter: The low-pass filter performs smoothing function for DAC output signals with a 20/40MHz 1st-order Butterworth frequency response.

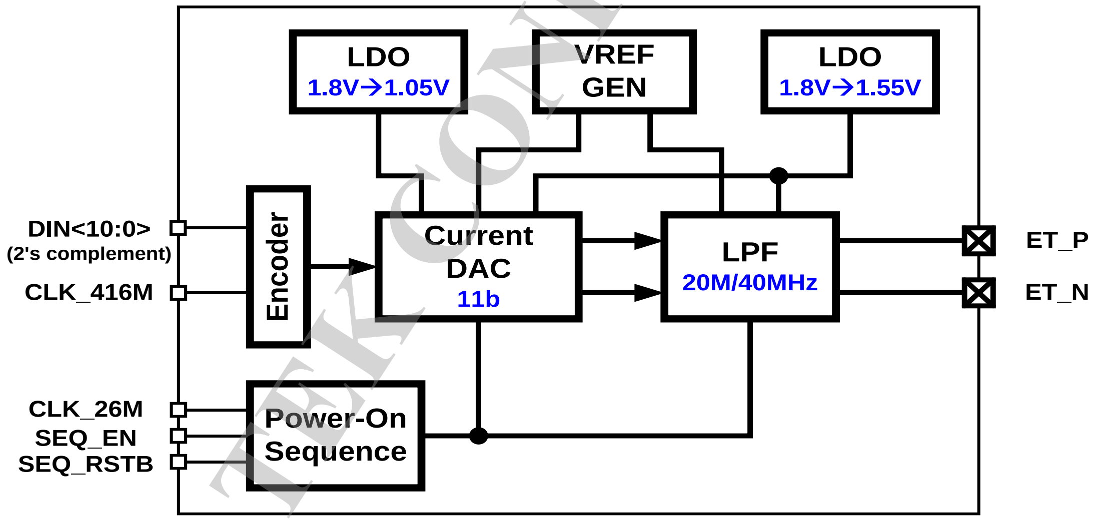

Figure 2-15. Block diagram of ETDAC

2.5.3.8 AUXADC

2.5.3.8.1 Block Descriptions

The auxiliary ADC includes the following functional blocks:

1. Analog multiplexer: Selects signal from one of the auxiliary input channels. There are 16 input channels of AUXADC. Some are for internal voltage measurement and some for external voltage measurement. Environmental messages to be monitored, e.g. temperature, should be transferred to the voltage domain.
2. 12-bit A/D converter: Converts the multiplexed input signal to 12-bit digital data.

See Table 2-20 for brief descriptions of AUXADC input channels.

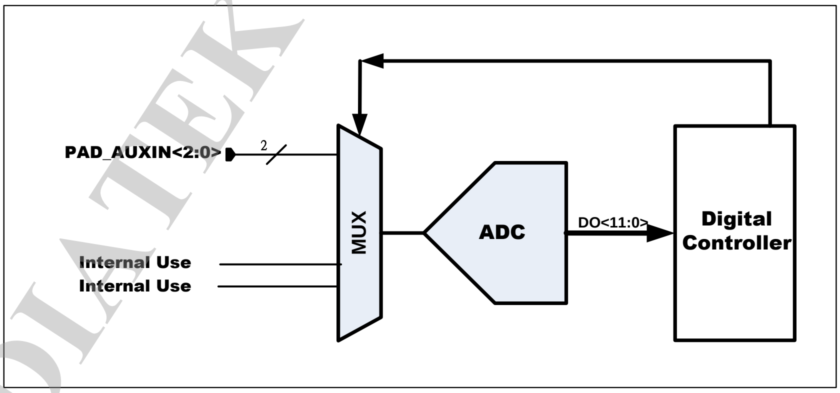

Figure 2-17. Block diagram of AUXADC

2.5.3.9 Clock Squarer

2.5.3.9.1 Block Descriptions

For most VCXO, the output clock waveform is sinusoidal with too small amplitude (about several hundred mV) to make digital circuits function well. The clock squarer is designed to convert such a small signal to a rail-to-rail clock signal with excellent duty-cycle.

2.5.3.9.2 Functional Specifications

See the table below for the functional specifications of clock squarer.

Table 2-22. Clock squarer specifications

Symbol	Parameter	Min.	Typ.	Max.	Unit
Fin	Input clock frequency	13	26		MHz
Fout	Output clock frequency	13	26		MHz
Vin	Input signal amplitude	350	500	1,000	mVpp
DcycIN	Input signal duty cycle		50		%
DcycOUT	Output signal duty cycle	DcycIN-5		DcycIN+5	%
TR	Rise time on pin CLKSQOUT			5	ns/pF
TF	Fall time on pin CLKSQOUT			5	ns/pF
DVDD	Digital power supply	0.81	1.0	1.1	V
AVDD	Analog power supply	1.7	1.8	1.9	V
T	Operating temperature	-20		80	°C
	Current consumption		500		uA

2.5.3.10 Phase Locked Loop

2.5.3.10.1 Block Descriptions

There are total 17 PLLs in PLL macro separated into 2 groups, providing several clocks for CPU, BUS, modem, analog modem, MSDC and image-sensor.

2.5.3.11 Temperature Sensor

2.5.3.11.1 Block Descriptions

In order to monitor the temperature of CPUs, several temperature sensors are provided. The temperature sensor is made of substrate BJT in the CMOS process. The voltage output of temperature sensor is measured by AUXADC.

2.5.3.11.2 Functional Specifications

See the table below for the functional specifications of temperature sensor.

3 MCU and BUS Fabric

3.1 MCU System

3.1.1 Introduction

MCUSYS is a subsystem responsible for running operating system and application programs in MT6735. It comprises with four Cortex-A53 cores into 1 cluster, and Generic Interrupt Controller (GIC). A 333MHz 128-bit AXI bus is directly connected to External Memory Interface (EMI) to minimize the access latency to DRAM and provide sufficient memory bandwidth. The peripheral system and on-chip storage are bridged through a 273MHz/64-bit AXI bus, and the outstanding capability of AXI protocol allows the system to exploit its maximum throughput from eight CPU cores.

MCUSYS supports DVFS technology which allows CPU to run at different frequency/voltage configurations for different application requirements. When in standby mode, MCUSYS can be completely shut down to further save power consumption and optimize the battery usage on mobile devices.

3.1.2 Features

3.1.2.1 Cluster 0, Cortex-A53 Specifications

- Four-core ARM® Cortex-A53 MPCore™ operating at 1.3GHz
- Supports ARMv8-A architecture for both 32 and 64-bit execution state
- Supports NEON multimedia processing engine with SIMDv2/VFPv4 ISA
- Optionally supports ARMv8 Cryptographic extension
- 32KB L1 I-cache and 32KB L1 D-cache
- 512KB unified L2 cache for CPU cluster
- DVFS technology with adaptive operating voltage from 0.95V to 1.25V
- Supports ARM Jazelle technology

3.1.2.2 Clock Modes Between Clusters and AXI Bus Fabric

The CPU and AXI bus fabric is synchronous and with integer clock ratio for example 1:1/1:2/1:4 for the best system performance. CPU and AXI bus fabric also support Dynamic Clock Management (DCM) mechanism to dynamically turn off the clock when no transactions are on the bus interface. CPU, cluster and AXI bus fabric can also support DVFS technology to lower power consumption.

3.1.3 Interrupt Controller

MT6735 uses ARM GIC400 interrupt controller for interrupt management. GIC400 is embedded inside MCUSYS alongside CCI to minimize the interrupt handling latency. For the interrupt connected

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

to GIC400, see the table below for details. The GIC interrupts are separated into 2 categories, the Private Peripheral Interrupts (PPI) and Shared Peripheral Interrupts (SPI). PPI occupies the first 32 interrupt slots in GIC and are banked for each CPU core. SPI begins from the 33rd interrupt and is shared by all CPU cores.

3.1.4 Register Definition

This section describes the registers defined in the MCUCFG_REG block in the MCU system.

Module name: mcucfg_reg Base address: (+10200000h)

Address	Name	Width	Register Function
10200620	**INT_POL_CTL0**	32	Interrupt Polarity Control
10200624	**INT_POL_CTL1**	32	Interrupt Polarity Control
10200628	**INT_POL_CTL2**	32	Interrupt Polarity Control
1020062C	**INT_POL_CTL3**	32	Interrupt Polarity Control
10200630	**INT_POL_CTL4**	32	Interrupt Polarity Control
10200634	**INT_POL_CTL5**	32	Interrupt Polarity Control
10200638	**INT_POL_CTL6**	32	Interrupt Polarity Control
1020063C	**INT_POL_CTL7**	32	Interrupt Polarity Control
10200650	**CCI_ADDRMAP**	32	CCI ADDR Map Register
10200654	**CCI_CONFIG**	32	CCI Config Register
10200658	**CCI_PERIPHBASE**	32	CCI Peripheral Base Register
1020065C	**CCI_nEVNTCNTOVFL**	32	CCI Performance Monitor Overflow
10200670	**XGPT_CTL**	32	
10200674	**XGPT_IDX**	32	
10200680	**MCUSYS_REVID**	32	MCUSYS Revision ID
10200684	**MCUSYS_RW_RSVD0**	32	Read and Write Reservation Register 0

MEDIATEK CONFIDENTIAL

3.2 On-chip Memory Controller

3.2.1 Introduction

The on-chip memory controller provides the boot ROM and SRAM resources.

3.2.2 Features

The memory controller has the following features

- 64KB on-chip ROM, with memory access protection and detection
- 64 KB on-chip SRAM, with memory access protection and detection
- 256 KB L2 share SRAM
- Chip ID

The following table is the memory map of on-chip ROM and SRAM.

Table 3-2. Memory map of on-chip memory controller

Bank	Start address	End address	Size	Device
0	0x0000_0000	0x0000_FFFF	64KB	ROM
	0x0010_0000	0x0010_FFFF	64KB	SRAM
	0x0020_0000	0x0023_FFFF	256KB	L2 Share SRAM

3.2.3 Block Diagram

The on-chip memory controller consists of a SRAM controller, a ROM controller, an AXI-FPC bus bridge, a bus interface unit, setting register and chip ID unit (see Figure 3-1). Detailed functionality is described in the following sections.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

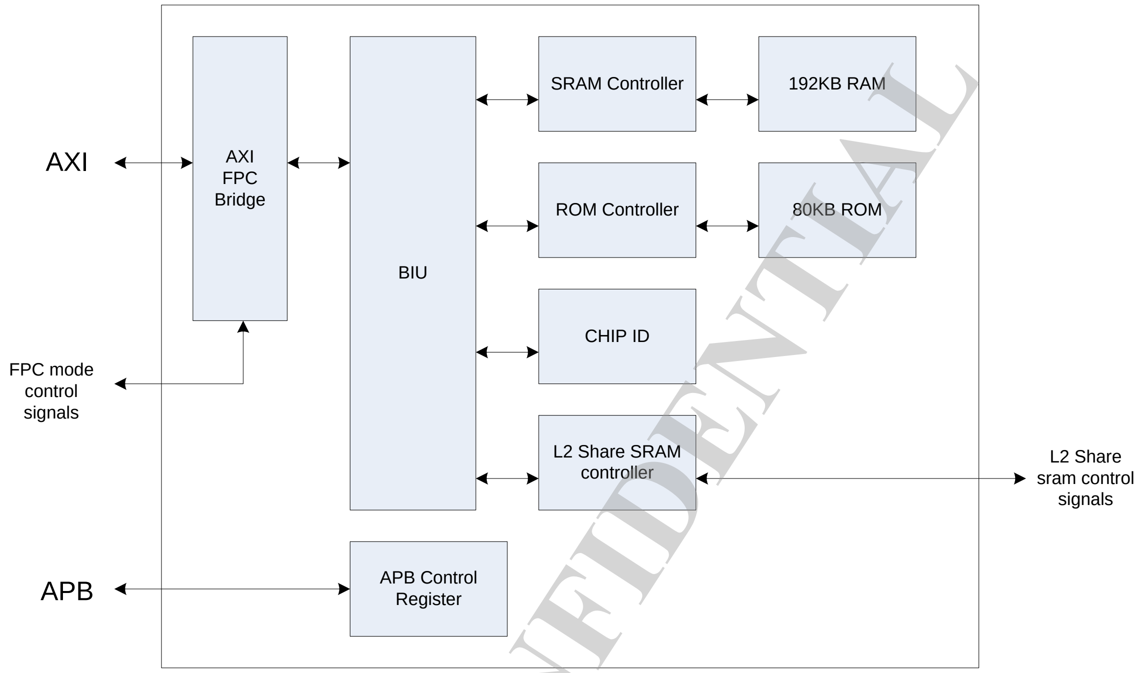

Figure 3-1. Block diagram of on-chip memory controller

3.2.3.1 BOOT ROM Power Down Mode

Boot ROM power down mode is used in the following scenarios:

1. After system boot, boot ROM will be powered down and prevented from any probe of ROM content
2. In MCDI (multi-core-deep-idle), it is the bootstrap for suspend/resume CPU.

The power down mode can be entered by setting *SRAMROM_SEC_CTRL.sramrom_sw_rom_pd* = 1. The bus interface unit will return a far jump instruction when receiving the read transactions. The jump address can be configurable by the *SRAMROM_BOOT_ADDR* register.

3.2.3.2 BOOT ROM FPC Mode

Boot ROM FPC mode is mainly used in Function Pattern mode. When the chip is trapped into FPC mode, the AXI-FPC bridge will block all the transactions to ROM address by returning a far jump instruction, with jump address specified in SRAMROM_FPC_BOOT_ADDR. The default value of SRAMROM_FPC_BOOT_ADDR is 0. The AXI-FPC bridge will automatically unblock the transaction when the FPC program is downloaded to SRAM memory address space.

3.2.3.3 On-Chip SRAM Security Protection

The on-chip SRAM can be partitioned into 2 regions with different security protection configurations. The bus interface unit performs permission check based on the settings, records the first violated

3.3 External Interrupt Controller

3.3.1 Introduction

The external interrupt controller (EINTC) processes all off-chip interrupt sources and forwards interrupt request signals to AP MCU.

3.3.2 Features

EINTC supports up to 213 external interrupt signals and performs the following processes to the interrupt signals coming from external sources:

- Polarity inversion
- Edge/level trigger selection
- De-bounce with a configurable 32kHz clock (optional)

According to the register configuration, the external interrupt source will be forwarded to the Cortex-A7 built-in interrupt controller with different IRQ signals, eint_irq or eint_direct_irq. EINTC generates wakeup events to AP MCU.

3.3.3 Block Diagram

Figure 3-3 is the block diagram of the external interrupt controller in MT6735. Every functional block is controlled by the corresponding control registers defined in next section.

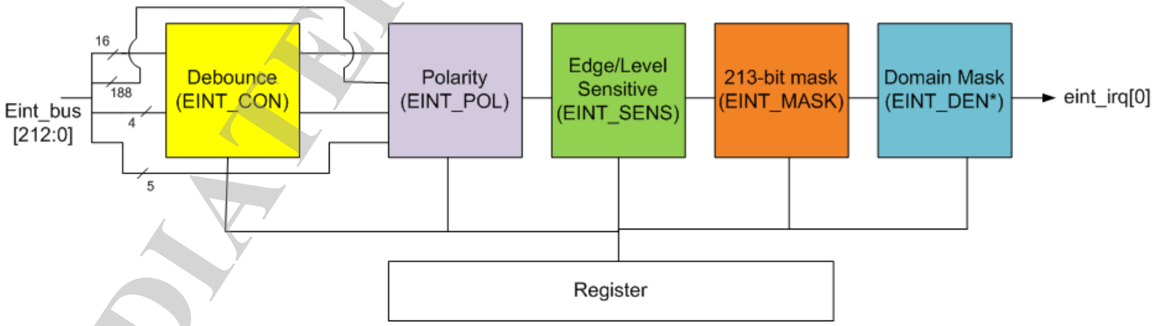

Figure 3-3. Block diagram of external interrupt controller

Normally the external interrupt source goes through the de-bounce unit which is driven by 32kHz clock and triggers the corresponding CPU with eint_irq. Therefore, the minimum latency from eint_bus to eint_irq is 30.52µs.

The following tables list the signal connections to the interrupt controller of CPU.

Table 3-3. External interrupt request signal connection

100051C4 EINT_SENS_CLR1 External Interrupt Sensitivity Clear Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	EINT_SENS_CLR1[31:16]															
Type	WO															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	EINT_SENS_CLR1[15:0]															
Type	WO															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
31:0		EINT_SENS_CLR1	Write 1 to specific bit to set up the sensitivity of corresponding external interrupt.

100051C8 EINT_SENS_CLR2 External Interrupt Sensitivity Clear Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	EINT_SENS_CLR2[31:16]															
Type	WO															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	EINT_SENS_CLR2[15:0]															
Type	WO															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description

3.3.5 Programming Guide

3.3.5.1 Register Bit Set/Clear

For efficient bit set up/clear operation, the following registers have specific bit set/clear registers:

- EINT_MASK
- EINT_SOFT
- EINT_DBNC
- EINT_POL

Write 1 to the specified bit of the set/clear register to set up or clear the corresponding bit in the status register.

3.3.5.2 Domain Control

For instance, if you would like int_bus[3] to trigger eint_irq[0], bit 3 in the EINT_D0EN register should be set.

3.3.5.3 EINT De-bounce Control Sequence

1. Set up EINT_CON (PRESCALER, POL, CNT) and enable de-bounce (EN).
2. Wait for 3*32K (~100us).
3. Write RSTDBC (self-clear).
4. Wait for 3*32K (~100us).
5. Write EINT_INTACK to ack/clear all statuses.
6. Unmask EINT_MASK.

3.4 System Interrupt Controller

3.4.1 Introduction

For processors which have embedded interrupt controllers (GIC) in it, the part of the MCUSYS will need to keep feeding clock and power to make interrupt functional. However, due to power/leakage overhead introduced by higher clock ratio and deep submicron processes, reserving an always on (or frequently turned on) domain in MCUSYS has became power ineffective. The system interrupt controller (SYS_CIRQ) is a low power interrupt controller designed to work outside MCUSYS as a second level interrupt controller. With SYS_CIRQ, the MCUSYS can be completely turned off to improve system power consumption without losing interrupts.

3.4.2 Features

SYS_CIRQ supports up to 159 interrupts which can configure following attributes individually.

- Polarity inversion
- Edge/level trigger selection

The 159 interrupts feed through SYS_CIRQ and connect to GIC in MCUSYS. When SYS_CIRQ is enabled, it will record the edge-sensitive interrupts and generate a pulse signal to CPU GIC when the flush command is executed.

3.4.3 Block Diagram

Figure 3-4 is the system level block diagram of the system interrupt controller.

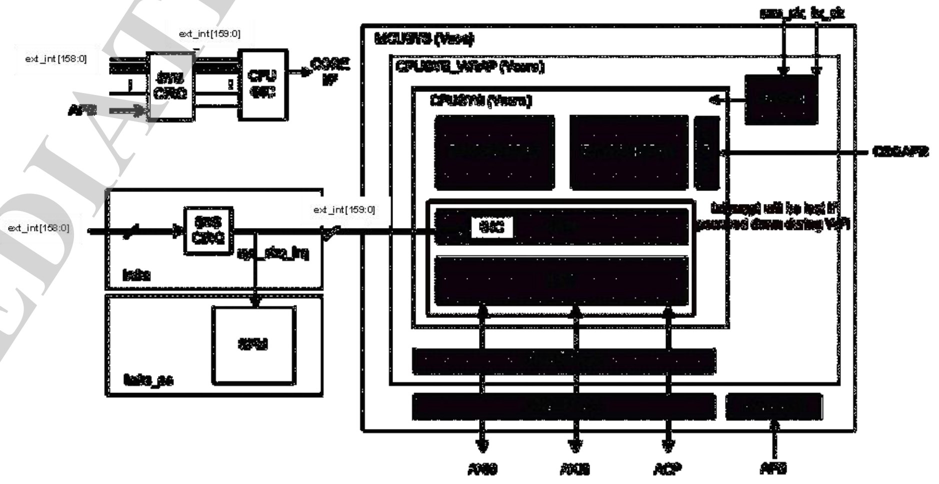

Figure 3-4. System level block diagram of system interrupt controller

© 2014 MediaTek Inc.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

The SYS_CIRQ controller is integrated in between MCUSYS and other interrupt sources as the second level interrupt controller. All interrupts are fed through SYS_CIRQ controller then bypassed to MCUSYS. In normal mode (where MCUSYS GIC is active), SYS_CIRQ is disabled and interrupts will be directly issued to MCUSYS. When MCUSYS enters the sleep mode, where GIC is power downed, the SYS_CIRQ controller will be enabled and monitor all edge-trigger interrupts (only edge-triggered interrupt will be lost in this scenario). When an edge-trigger interrupt is triggered, it will be recorded in SYS_CIRQ_STA register and can be restored to GIC by SW context restore or the SYS_CIRQ flush function.

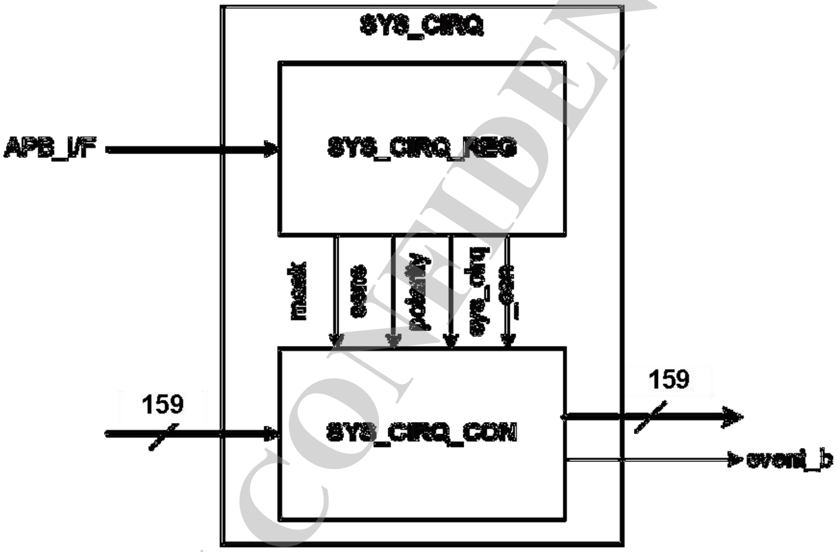

Figure 3-5. Block diagram of system interrupt controller

Figure 3-5 is the architecture of SYS_CIRQ. SYS_CIRQ_REG stores the mask/sensitivity/polarity attributes of each interrupt signal, and SYS_CIRQ_CON is used to mask and detect edge-triggered interrupts.

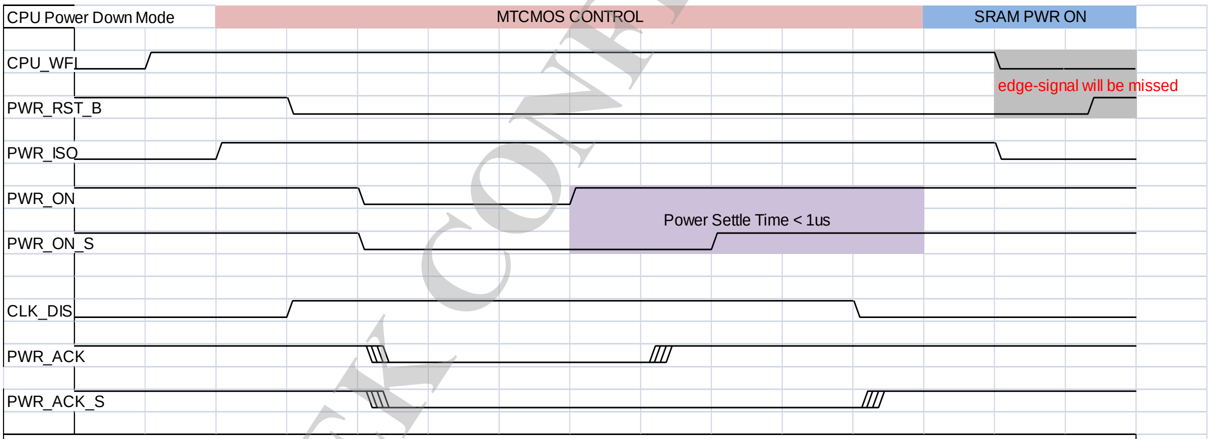
1		CIRQ_EDGE_ONLY	**Sets up edge-only mode** Only edge-triggered interrupt will be recorded.
0		CIRQ_EN	**Enable bit of system CIRQ controller**

3.4.5 Programming Guide

3.4.5.1 MCUSYS MTCMOS Sequence



Note:
1. MEM_CKISO should connect to PISO cell to isolate the CLOCK and CHIP SEL input ports of SRAM to LOW
2. All the MEM_PDN and MEM_SLEEP_B signals come from the SPM in always power on domain.
3. MEM_SLEEP_B should always keep HIGH when SRAM power down
4. All the signals are controled by CPU(Software) or SPM

3.5 Infrastructure System Configuration Module

3.5.1 Introduction

The infrastructure system configuration module (INFRACFG) provides reset, clock and miscellaneous control signals in the infrastructure system.

3.5.2 Features

INFRACFG provides the following control signals to the functional blocks inside the infrastructure system:

- Software reset signals
- Clock gating control signals
- Dynamic clock management control signals
- Top AXI bus fabric control signals
- Dynamic clock management function

3.5.2.1 DCM in Details

The dynamic clock management function is used to slow down the clock frequency for power saving when the system is in idle state automatically.

Figure 3-6 gives a sample clock waveform when DCM is activated. In this example, the clock frequency in DCM mode is set to quarter of the original clock. The ratio of clock frequency slow-down is controlled by the INFRA_DCMFSEL register.

After the bus idle signal is low, it will take several cycles of latency to make the slow-down clock return to the normal frequency. The cycle number varies with the runtime status of the clock gating logic and will somehow cause minor performance impact. In order to minimize the impact when the system is in heavy load status, the INFRA_DCMDBC register controls the cycle count once the bus idle signal is asserted. Setting the de-bounce cycle to be longer and enabling the function will reduce the probability of the system entering the DCM mode.

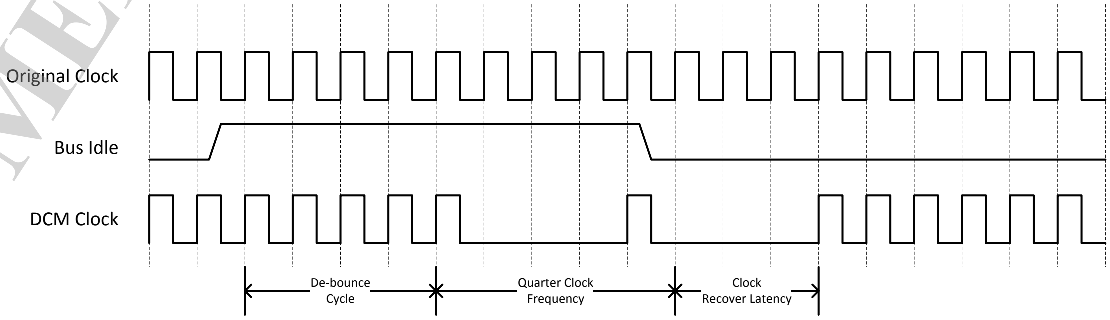

Figure 3-6. DCM in action

3.5.2.2 AXI Fabric Control

The AXI fabric control registers help prevent the system bus from hanging up caused by improper access while some parts of the system are in the power-down state. See the figure below for the location of SI node 0 to SI node 4 and the sleep protector and find the corresponding control registers in section 3.5.3 "Register Definition".

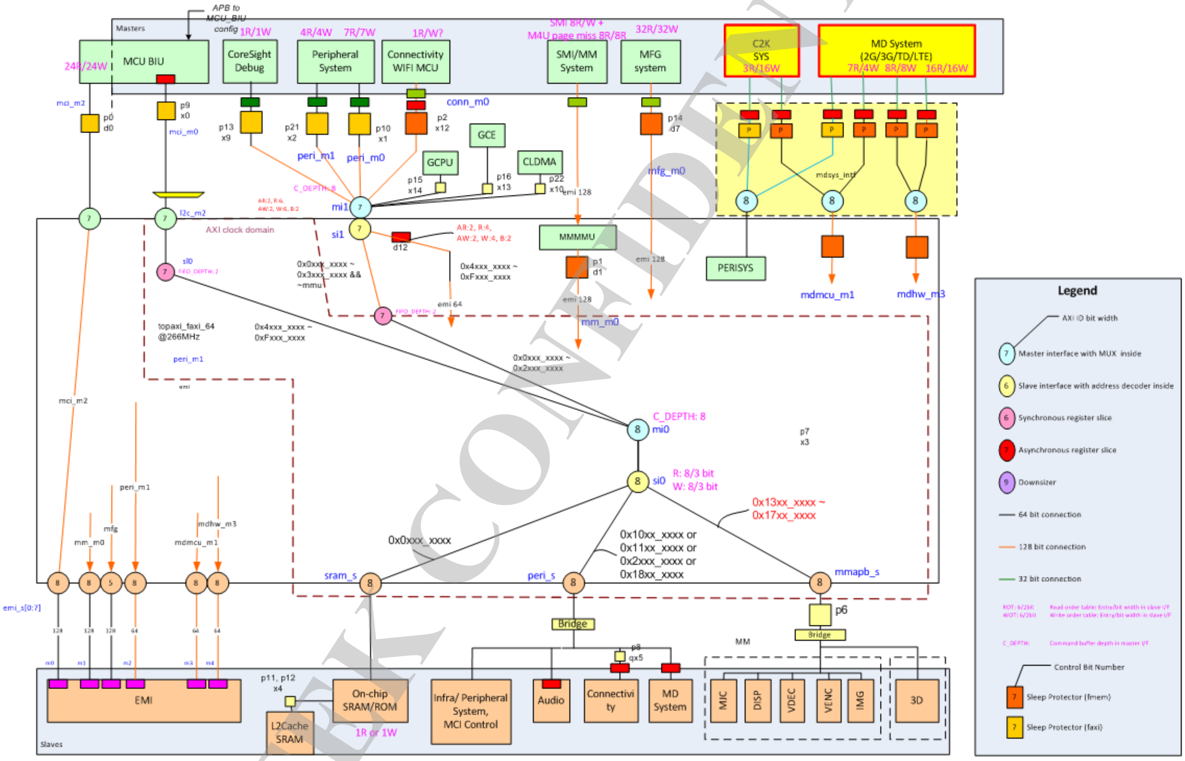

Figure 3-7. Top AXI fabric and control blocks

3.6 External Memory Interface

3.6.1 Introduction

The EMI controller schedules requests from the masters and issues commands to DRAMC in a efficiency way. The block conducts flow control for DRAMC and masters to avoid DRAM stall or data overflow or underflow. It also minimizes the latency of processor path to enhance the performance and tries to increase the DRAM efficiency. The block also informs clock control to gate the clock when it does not find any transaction right now. This block is designed to supply 266MHz bus clock frequency and can be scaled down to 195MHz.

3.6.2 Features

The EMI controller receives AXI master commands and issues them to the DRAM controller. It supports all AXI transaction type commands except for the fixed and cache commands. There are plenty of schedule options to schedule the command, which are:

- Starvation control
- Bandwidth limiter
- High priority
- Page hit control
- Read/write turn around prevent control

3.6.3 Block Diagram

In MT6735, the DRAM controller connects three systems via six AXI ports and supports connecting two rank DRAM devices at the same time. For cortex APMCU system, we provide a 128-bit AXI port for the connection. For the multimedia system, we provide a 128-bit AXI port for the connection. Besides, we provide three 64-bit AXI ports for connecting to modem MCU, modem 2G/3G HW and peripheral system. In the DRAM controller, the APB interface is for programming registers. Then we can initialize DRAM or other parameter settings.

Bit(s)	Name	Description
31:24	RD_INTERLEAVE_DIS	**Disables read data interleave function by port.**
23:20	BW_THR	**EMI BW threshold length** If BW usage is less than BW_THR/16, EMI will force M0 ultra. 0: Always non-ultra 1: 1/16 BW ... 14: 14/16 BW 15: Always enable ultra
19	RD_DATA_MODE	0: Mask master of DRAMC input data before SRAM arbiter. 1: Mask master of DRAMC input data after SRAM arbiter.
18	WCMD_MDMCU_SUPER	**MDMCU write high priority command has higher priority than other write commands.**
17	RCMD_MDMCU_SUPER	**MDMCU read high priority command has higher priority than other read command.**
16	WR_CHK_ORDER	**Writes command to DRAMC keep ID order**
15:14	BW_THR_LEN	**EMI BW threshold length** If BW usage is less than BW_THR/16, EMI will force M0 ultra. 2'b00: 256 cycles 2'b01: 512 cycles 2'b10: 1,024 cycles 2'b11: 2,048 cycles.
13	M0_SHORT_DIS	**When all FIFOs are unused, APMCU reads can bypss read command FIFO to reduce 1 cycle latency.** 0: Enable 1: Disable
12	RCMD_ISSUE_IN_ORDER	**Read command issue to DRAMC is in order** 0: Out- of- order 1: In order
11	EARLY_RSP_DIS	0: Enable early response function 1: Disable early response function
10	EARLY_RESP_PRO_WR_DIS	**When read early response occurs, EMI sets up related write FIFO to be expired.**
9	SBR_MASK_CHK	0. Non-SBR command does not check reorder mask. 1: Non-SBR command checks reorder mask.
8	DBG_OUT_EN	**Enables debug output**
7	WR_ULTRA_WO_MASK	**1: Ultra write command with starvation counter =0 doesn't need to defer read ultra with starvation counter =0**
6	RSV_CHK_DQ	**When EMI reserves buffer for AP, ultra and normal,** 0: Check command FIFO only 1: Check command and data FIFO
5	BYTE32_WRAP_EN	**Processes wrap command in 32-byte alignment** 0: Process wrap command in 16-byte alignment 1: Process wrap command in 32-byte alignment
4	HALF_AGE_EN	**Shortens starvation value for high priority command** 0: Does not shorten starvation value 1: Shorten starvation value for high priority command
3	COMMAND_SPLIT_EN	**Splits long burst read command into two short commands.** 0: Does not split read command 1: Split read command
2	RFF_PBC_MASK_EN	**Masks write command when row conflict with read command.** 0: Write commands will not be masked. 1: Mask write commands

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Bit(s)	Name	Description
1	RD_PBC_MASK_EN	**Masks read command when row conflict with read command.** 0: Read commands will not be masked. 1: Mask read commands
0	PREULTRA_ENABLE	**When this feature is enabled, FIFO has the same ID as command arbiter granted ultra and preultra command.** 1. Starvation counter /2 or /4 by setting 2. Starvation counter doesn't check BW limiter.

Bit(s)	Name	Description
17	R9_VIO	**Region 9 abort violation status to Domain 3** 0: No Region 1 abort violation 1: Region 1 abort violation
16	R8_VIO	**Region 8 abort violation status to Domain 3** EMI will first record the unmask device abort information at EMI_MPUS and EMI_MPUT if unmasking and set up the corresponding R0_VIO status bit. Clear R0_VIO for EMI to record the next violation status. When multiple violations occur, the corresponding D0_VIO_STA status bit will be set. However, only the device abort information will be recorded at VIO_DBGx, and its content will not be changed until the software clears it. 0: No Region 0 abort violation 1: Region 0 abort violation
9	OOR_VIO	**Out of range abort violation status to Domain 3** 0: No out of range abort violation 1: Out of range abort violation
8	APB_VIO	**APB abort violation status to Domain 3** 0: No APB abort violation 1: APB abort violation Note: EMI_MPUR is allowed to be accessed in the secure mode only when D2_SEC = 1.
7	R7_VIO	**Region 7 abort violation status to Domain 3** 0: No Region 7 abort violation 1: Region 7 abort violation
6	R6_VIO	**Region 6 abort violation status to Domain 3** 0: No Region 6 abort violation 1: Region 6 abort violation
5	R5_VIO	**Region 5 abort violation status to Domain 3** 0: No Region 5 abort violation 1: Region 5 abort violation
4	R4_VIO	**Region 4 abort violation status to Domain 3** 0: No Region 4 abort violation 1: Region 4 abort violation
3	R3_VIO	**Region 3 abort violation status to Domain 3** 0: No Region 3 abort violation 1: Region 3 abort violation
2	R2_VIO	**Region 2 abort violation status to Domain 3** 0: No Region 2 abort violation 1: Region 2 abort violation
1	R1_VIO	**Region 1 abort violation status to Domain 3** 0: No Region 1 abort violation 1: Region 1 abort violation
0	R0_VIO	**Region 0 abort violation status to Domain 3** 0: No Region 0 abort violation 1: Region 0 abort violation

3.6.5 Programming Guide

To start EMI function, program the settings in the following manner.

1. Program supporting one channel DRAM.
2. Program DRAM address mapping type, e.g. column bit number, row bit number and bank bit number. Put the address map as “row, ban, chn, col” or “ban[2], row, ban[1:0], chn, col” or “row, ban, col”.
3. Set the DRAM bit number to 16 bits or 32 bits data bus.
4. Program the latency for each AXI interface of which the request will be set to high priority when the age counter expires. (In the beginning, treat all the requests from one AXI port as the same ID.)
5. Allocate the bandwidth requirement for each AXI port and set up the bandwidth limiter value. Next, guarantee that the total bandwidth set does not exceed 100%.
6. Set up the bandwidth limiter for each AXI ports as soft limit or hard limit.
7. Program the security region addresses and numbers.

3.7 DRAM Controller

3.7.1 Overview

DRAM controller supports the following DRAM bus configuration:

1. LPDDR2 32-bit @ 533MHz (1,066M bps/per bit channel)
2. LPDDR3 32-bit @ 667MHz (1,333M bps/per bit channel)

See the table below for the DRAM bus signals:

Table 3-5. DRAM bus signal list (refer to DRAMC side)

Signal name	Type	Description
CK0/CK1	Input	DRAM clock signal
CK0#/CK1#	Input	DRAM clock invert signal
MA[9:0]	Input	Address for all memories/CA bus for LPDDR2/3
CKE	Input	Clock enable signal for DRAM
CS# [1:0]	Input	RANK1~RANK0 selection signal
DQ[31:0]	I/O	Data bus for LPDDR2/LPDDR3
DQM[1:0]	Input	Data mask
DQS[3:0]	I/O	Data strobe
DQS#[3:0]	I/O	Differential data strobe in LPDDR2/3
REXTDN	I/O	Output driving calibration

These tables are applied when CKE is asserted at the clock cycle before CS# is asserted. Read and write accesses to the DDR SDRAM are burst oriented. The accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. The accesses begin with the registration of an ACTIVE command, followed by a READ or WRITE command. The address bits registered coincident with the ACTIVE command are used to select the bank and row to be accessed. The address bits registered coincident with the READ or WRITE command are used to select the bank and the starting column location for the burst access.

As with standard SDRAMs, the pipelined, multi-bank architecture of DDR SDRAMs allows for concurrent operation, thereby providing high effective bandwidth by hiding row precharge and activation time.

The DDR SDRAM operates from a differential clock (CK and CK#). Commands (address and control signals) are registered at every positive and negative edges of CK for LPDDR2/3. The input data are registered on both edges of DQS, and the output data are referenced to both edges of DQS, as well as to both edges of CK. DQS is center-aligned with data for WRITEs. Without DLL inside mobile DRAM's (LPDDR2/3), DQS is not edge-aligned with data for READs.

The commands for LPDDR2/3 SDRAM are encoded in MA0 ~ MA9 and transfer at double rate of clock frequency such as DQ.

Other key points of Denali DRAM controller:

- Supports column address bit number from 8 to 11
- Supports DRAM burst length 4 and 8
- Supports maximum LPDDR2/3 8G-bit device

3.7.2 Features

- 128-bit data bus interface with BE[15:0] for write data mask
- LEN has 4-bit, 0 ~ 15 DLE's/WDLE's
- Supports END_SIZE for optimize utilization rate
- Supports WDLE for split transaction
- Supports HDLE (DLE64) side band signal for early responses
- Supports high-priority side band signal for reducing request latency
- A request cannot cross page boundary
- Supports 2X frequency mode (frequency ratio of DRAMC:DRAM = 1:2) for timing optimization
- Supports dual-scheduler function for 1T command rate under 2X frequency mode for performance optimization
- Supports power-down and self-refresh for power saving
- Supports clock stop for power saving
- Supports input DQS/DQ timing calibration for PVT variation
- Supports read/write command out of order control

3.7.3 Block Diagram

The major blocks of DRAM controller are command decoder, command pool, bus scheduler, timing controller DDR PHY and response generator.

The requests from Arbiter are pushed to command pool to wait for execution in order. The bus scheduler inspects the precharge/active pool and command FIFO and decides which DRAM bus command, e.g. PRECHARGE, ACTIVE, READ or WRITE, is issued to the DRAM bus. The goals of bus scheduler are to raise the bus utilization rate and lower the response latency. The timing control unit is responsible for the integrity of DRAM bus timing such as pre-charge to active delay (tRP), active to command delay (tRCD) and bus turnaround time. The bus scheduler refers to the information and choose the next DRAM bus command. The DRAM interface unit is responsible for generating DRAM bus commands, transmitting data and DQS to DDR DRAM and receiving data and DQS from DDR DRAM. The response generator produces the response signals for all DRAM agents such as DLE and RDAT.

3.7.5 Programming Guide

Steps of DRAM initialization

1. Set up DRAM AC timing parameter.
2. Follow DRAM spec to complete DRAM initialization including mode register programming.
3. Enable calibration for DQ/DQS window.

3.8 AP_DMA

3.8.1 Introduction

There is always a DMA in a platform. The purpose of DMA is performing data transfer between different slaves. There are several slaves in a platform, and the major one is external memory, e.g. DRAM. There are also internal SRAM and some slave ports for the peripheral to transfer data. For saving software efforts, DMA delivers a virtual FIFO concept to help the software maintain read and write pointer when the software accesses data from a ring buffer. As the bus goes more and more efficient, the old DMA still utilizes the AHB bus protocol and may decrease its performance. Another problem is that when the old DMA meets byte alignment addresses or byte alignment sizes, it will need some software efforts to help solve head and tail non word alignment problems or let DMA to simply issues single-1-byte requests to conquer the byte-alignment problem. This will harm the overall system because the single-1-byte transaction is quite inefficient. The DMA efficiency is now improved by increasing its bus efficiency, including data buffering and overcoming byte alignment problems.

3.8.2 Features

APDMA has the following DMA engines.

- HIF DMA engine*1
- IRDA DMA engine*1
- I2C DMA engine*4
- UART0 TX DMA engine*1
- UART0 RX DMA engine*1
- UART1 TX DMA engine*1
- UART1 RX DMA engine*1
- UART2 TX DMA engine*1
- UART2 RX DMA engine*1
- UART3 TX DMA engine*1
- UART3 RX DMA engine*1
- UART4 TX DMA engine*1
- UART4 RX DMA engine*1
- UART4 TX DMA engine*1
- UART4 RX DMA engine*1

The DMA engines and corresponding peripheral devices are listed below.

Table 3-7. Relationship between engines and devices

Engine	Peripheral device
HIF_0	Connsys (sdctl)
IRDA_0	IRDA
I2C_0 ~ I2C_3	I2C_0 ~ I2C_3

MEDIATEK CONFIDENTIAL

Engine	Peripheral device
UART0 ~ UART3	UART0 ~ UART3
UART4	BTIF
UART4	C2K

3.8.3 Block Diagram

Figure 3-10 is the basic block diagram of AP_DMA. There are total 15 channels in DMA. The external AXI interface is connected to the peripheral AXI bus fabric to provide external memory access ability. The internal AXI interface is also connected to the peripheral AXI bus fabric and is re-directed to related peripherals, e.g. HIF, I2C and UART. A memory block is used as a buffer which makes the transfer on the AXI bus interface more efficient. An APB interface is used to program registers for both global registers and local registers existing in every individual DMA channel.

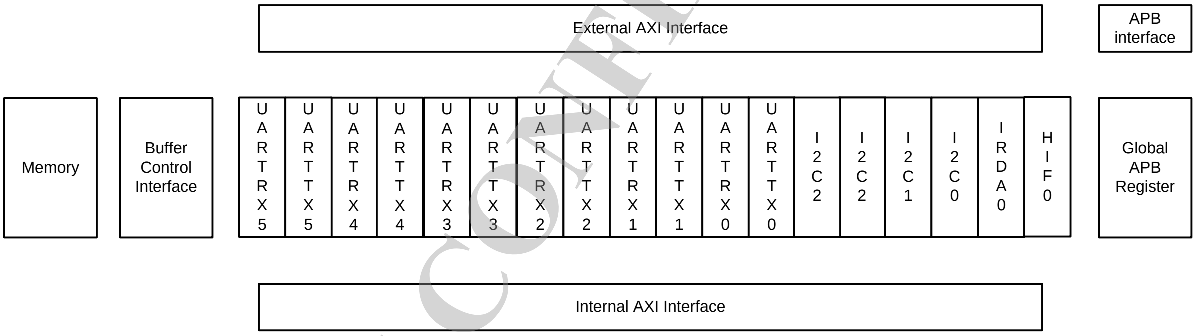

Figure 3-10. APDMA block diagram

3.8.4 Register Definition

3.8.4.1 Global Control Registers

There are several registers put together for the software to monitor. However, if the software is to change them, they can only be written through individual DMA registers. The global register is only for the software to watch all DMA running statuses and interrupt flags together. Note that the security ability of all global registers belongs to the GSEC_EN bit. When this bit is set to 1, only the security transaction can write the global register (global reset and global slow-down). If a non-security read transaction is issued to read the interrupt flag or running status, only statuses of non-security engines can be reported, and others will always be 0.

Module name: AP_DMA Base address: (+11000000h)

Address	Name	Width	Register Function
11000000	AP_DMA_GLOBAL_INT_FLAG	32	AP DMA Global Interrupt Flag Register
11000004	AP_DMA_GLOBAL_RST	32	AP DMA Reset Register
11000008	AP_DMA_GLOBAL	32	AP DMA Global Running Status Register

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																FLAG0
Type																RW
Reset																0

Bit(s)	Name	Description
0	FLAG0	**Write 0 to clear it.** Interrupt will be issued to HW when FLAG=1. Mechanism: 1. SW puts data into VFF and detects TX_VFF_LEFT_SIZE is approaching 0. 2. SW sets INTEN=1 and leaves the task to wait for interrupt. 3. When HW delivers enough data to UART and makes TX_VFF_LEFT_SIZE >= TX_VFF_THRS, HW sets the flag to 1 and issues interrupt. 4. When SW receives this interrupt, it must set FLAG back to 0 and go on pushing data into VFF.

However, even after flush there may still be data in residual due to MCU keeps putting data or in-coherent problems (data received by VFF_W behind receiving flush even MCU issues data first). Therefore, SW must recheck the residual data. If not 0, flush again. *Note: STOP and FLUSH cannot be set to 1 in the same operation.* 0: Flush finished 1: Enable

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																FLAG0
Type																RW
Reset																0

Bit(s)	Name	Description
0	FLAG0	**Write 0 to clear it.** Interrupt will be issued to HW when FLAG=1. Mechanism: 1. SW puts data into VFF and detects TX_VFF_LEFT_SIZE is approaching 0. 2. SW sets INTEN=1 and leaves the task to wait for interrupt. 3. When HW delivers enough data to UART and makes TX_VFF_LEFT_SIZE >= TX_VFF_THRS, HW sets the flag to 1 and issues interrupt. 4. When SW receives this interrupt, it must set FLAG back to 0 and go on pushing data into VFF.

11000484 **AP_DMA_UART_1_TX_INT_EN** **UART1 TX Virtual FIFO Interrupt Enable Register** **00000000**

110004D8	AP_DMA_UART_1_TX_VFF_WPT_VALID	UART1 TX Virtual FIFO Write Pointer Register by HW Control	00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																TX_VFF_WPT_WRAP_VALID
Type																RO
Reset																0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	TX_VFF_WPT_VALID															
Type	RO															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit(s)	Name	Description
16	TX_VFF_WPT_WRAP_VALID	**TX VFF write pointer wrap bit** If FLUSH= 0, sync to TX_VFF_WPT_WRAP. If flush, it will not update the value until the flush is finished.
15:0	TX_VFF_WPT_VALID	**TX VFF write pointer** If FLUSH= 0, sync to TX_VFF_WPT. If flush, it will not update the value until the flush is finished.

110004E0	AP_DMA_UART_1_TX_FLUSH_ACT	UART1 TX Virtual FIFO Flush Status Register	00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name																
Type																
Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name															FLUSH_NEXT	FLUSH_ACT
Type															RO	RO
Reset															0	0

Bit(s)	Name	Description
1	FLUSH_NEXT	There is a flush command when the UART1 TX channel is flushing.
0	FLUSH_ACT	UART1 TX channel flush status

110004E4	AP_DMA_UART_1_TX_HW_FLUSH	UART1 TX Virtual FIFO HW Flush Register	00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name

Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																FLAG0
Type																RW
Reset																0

Bit(s)	Name	Description
0	FLAG0	**Write 0 to clear it.** Interrupt will be issued to HW when FLAG=1. Mechanism: 1. SW puts data into VFF and detects TX_VFF_LEFT_SIZE is approaching 0. 2. SW sets INTEN=1 and leaves the task to wait for interrupt. 3. When HW delivers enough data to UART and makes TX_VFF_LEFT_SIZE >= TX_VFF_THRS, HW sets the flag to 1 and issues interrupt. 4. When SW receives this interrupt, it must set FLAG back to 0 and go on pushing data into VFF.

11000584	AP_DMA_UART_2_TX_INT_EN	UART2 TX Virtual FIFO Interrupt Enable Register	00000000

Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Name	Description
0	FLAG0	**Write 0 to clear it.** Interrupt will be issued to HW when FLAG=1. Mechanism: 1. SW puts data into VFF and detects TX_VFF_LEFT_SIZE is approaching 0. 2. SW sets INTEN=1 and leaves the task to wait for interrupt. 3. When HW delivers enough data to UART and makes TX_VFF_LEFT_SIZE >= TX_VFF_THRS, HW sets the flag to 1 and issues interrupt. 4. When SW receives this interrupt, it must set FLAG back to 0 and go on pushing data into VFF.

11000684 **AP_DMA_UART_3_TX_INT_EN** **UART3 TX Virtual FIFO Interrupt Enable Register** **00000000**

Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																FLAG0
Type																RW
Reset																0

Bit(s)	Name	Description
0	FLAG0	**Write 0 to clear it.** Interrupt will be issued to HW when FLAG=1. Mechanism: 1. SW puts data into VFF and detects TX_VFF_LEFT_SIZE is approaching 0. 2. SW sets INTEN=1 and leaves the task to wait for interrupt. 3. When HW delivers enough data to UART and makes TX_VFF_LEFT_SIZE >= TX_VFF_THRS, HW sets the flag to 1 and issues interrupt. 4. When SW receives this interrupt, it must set FLAG back to 0 and go on pushing data into VFF.

Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																EN
Type																A0
Reset																0

Bit(s)	Name	Description
0	EN	**Enables UART4 TX virtual FIFO** Set EN to 1 to start DMA. When DMA is busy, EN will always be 1. When warm reset is set, EN will be 0 after the nearest transaction is finished, and all statuses in DMA will be reset. When hard reset is set, EN will immediately become 0, and all statuses in DMA will be reset. When EN = 0 and MCU writes data to the VFF_W port (an AHB slave port), VFF_W will ignore this command, and the data will not be written to virtual FIFO. 0: Disable 1: Enable

1100078C	AP_DMA_UART_4_TX_RST	UART4 TX Virtual FIFO Reset Register	00000000

MEDIATEK CONFIDENTIAL

Bit(s)	Name	Description
0	FLUSH	**Flushes UART4 TX virtual FIFO** Set FLUSH to 1 to allow DMA flush its internal buffer residual data to EMI. However, even after flush there may still be data in residual due to MCU keeps putting data or in-coherent problems (data received by VFF_W behind receiving flush even MCU issues data first). Therefore, SW must recheck the residual data. If not 0, flush again. *Note: STOP and FLUSH cannot be set to 1 in the same operation.* 0: Flush finished 1: Enable

1100079C AP_DMA_UART_4_TX_VFF_ADDR UART4 TX Virtual FIFO Base Address Register 00000000

Bit(s)	Name	Description
0	FLUSH	**Flushes UART5 RX virtual FIFO** Set FLUSH to 1 to allow DMA flush its internal buffer residual data to EMI. However, even after flush there may still be data in residual due to MCU keeps putting data or in-coherent problems (data received by VFF_W behind receiving flush even MCU issues data first). Therefore, SW must recheck the residual data. If not 0, flush again. *Note: STOP and FLUSH cannot be set to 1 in the same operation.* 0: Flush finished 1: Enable

3.8.5 Programming Guide

3.8.5.1 Warm Reset and Hard Reset

Warm reset and hard reset exist in DMA global control and each DMA engine. When warm reset is set, the engine will be reset after the current transaction is finished, and therefore the warm reset will not cause any bus hang. Conversely, when hard reset is set, the engine will be reset immediately, and therefore the bus may go down due to unfinished (and will never finish) transaction.

Mechanism of global warm reset

When the software is to re-start all engines or re-clear all engines in DMA, it can set the global WARM_RST to 1 and wait for (poll) all global running status to be 0. Next, set WARM_RST back to 0 to finish the global warm reset.

Mechanism of global hard reset

When the software is to re-start all engines or re-clear all engines in DMA without waiting for any period of time, it can set the global HARD_RST to 1 then back to 0 to finish the global hard reset. Note that this may break the bus protocol and cause system hang.

3.8.5.2 Pause and Resume

There are pause and resume functions available for general DMA and peripheral DMA. The mechanism is as the following:

1. Start DMA. (Program necessary settings, then set EN = 1.)
2. Pause DMA. (Set PAUSE = 1.)
3. Resume DMA. (Set PAUSE = 0.)
4. Wait for DMA to finish. (EN will become 0, and flag will be set to 1.)

The software can repeat step 2 and 3 many times when DMA is running and monitor the idle bit to see if DMA is stopped. DMA will not pause immediately and will wait for the last transaction to be finished.

3.9 CQDMA

3.9.1 Introduction

There is always a DMA in a platform. The purpose of DMA is performing data transfer between different slaves. There are several slaves in a platform, and the major one is external memory, e.g. DRAM. There are also internal SRAM and some slave ports for the peripheral to transfer data. For saving software efforts, DMA delivers a virtual FIFO concept to help the software maintain read and write pointer when the software accesses data from a ring buffer. As the bus goes more and more efficient, the old DMA still utilizes the AHB bus protocol and may decrease its performance. Another problem is that when the old DMA meets byte alignment addresses or byte alignment sizes, it will need some software efforts to help solve head and tail non word alignment problems or let DMA to simply issues single-1-byte requests to conquer the byte-alignment problem. This will harm the overall system because the single-1-byte transaction is quite inefficient. The DMA efficiency is now improved by increasing its bus efficiency, including data buffering and overcoming byte alignment problems.

3.9.2 Features

CQDMA has the following DMA engines.

- GDMA engine

3.9.3 Block Diagram

Figure 3-11 is the basic block diagram of CQ_DMA. There is one channel in DMA. The external AXI interface is connected to DRAM to provide external memory access ability. A memory block is used as a buffer which makes the transfer on the AXI bus interface more efficient. An APB interface is used to program registers for both global registers and local registers existing in every individual DMA channel.

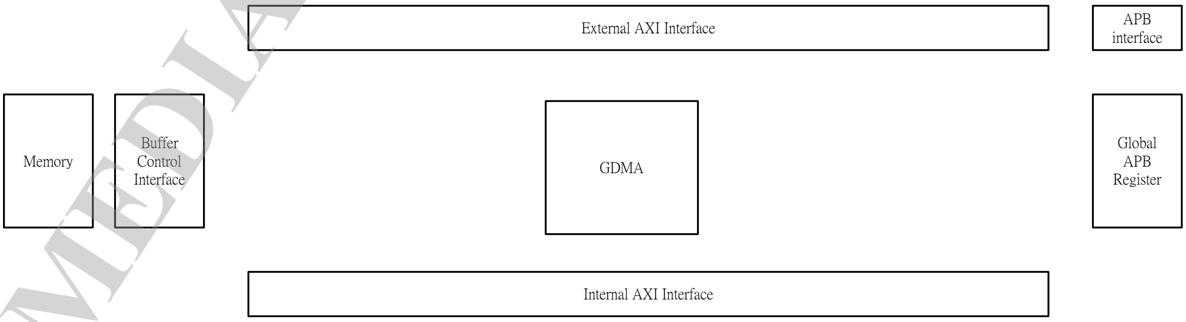

Figure 3-11. APDMA block diagram

3.9.4 Register Definition

3.9.4.1 Global Control Registers

There are several registers put together for the software to monitor. However, if the software is to change them, they can only be written through individual DMA registers. The global register is only for the software to watch all DMA running statuses and interrupt flags together. Note that the security ability of all global registers belongs to the GSEC_EN bit. When this bit is set to 1, only the security transaction can write the global register (global reset and global slow-down). If a non-security read transaction is issued to read the interrupt flag or running status, only statuses of non-security engines can be reported, and others will always be 0.

See the table below for CQ_DMA engine control registers.

Module name: CQ_DMA Base address: (+10217C00h)

Address	Name	Width	Register Function
10217C00	CQ_DMA_G_DMA_INT_FLAG	32	General DMA Interrupt Flag Register
10217C04	CQ_DMA_G_DMA_INT_EN	32	General DMA Interrupt Enable Register
10217C08	CQ_DMA_G_DMA_EN	32	General DMA Enable Register
10217C0C	CQ_DMA_G_DMA_RST	32	General DMA Reset Register
10217C10	CQ_DMA_G_DMA_STOP	32	General DMA Stop Register
10217C14	CQ_DMA_G_DMA_FLUSH	32	General DMA Flush Register

Bit(s)	Name	Description
0	FLAG	**This flag will be raised when DMA is finished.** Write 0 to clear it. 1. When normal operation is done, EN will be set from 1 to 0, and the interrupt flag will be set to 1. 2. Set STOP=1 and operation will be done, then EN will be set from 1 to 0, and the interrupt flag will be set to 1. 3. Set FLUSH=1 and operation will be done, then EN will be set from 1 to 0, and the interrupt flag will be set to 1. 4. Set WARM_RST=1 and operation will be done, then EN will be set from 1 to 0, but the interrupt flag will not be set to 1. 5. Set HARD_RST=1 and operation will be done, then EN will be set from 1 to 0, but the interrupt flag will not be set to 1.

10217C04 CQ_DMA_G_DMA_INT_EN General DMA Interrupt Enable Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																**FLUSH**
Type																RW
Reset																0

Bit(s)	Name	Description
0	FLUSH	**Flushes general DMA** Set FLUSH to 1 to stop DMA and allow DMA to flush its internal buffer residual data to the outer memory. After flush is finished, DMA will set EN to 0 to stop DMA. There may still be data not transferred (len may not be 0 after EN = 0). SW sets FLUSH to 1 and waits for EN to become 0 then set FLUSH back to 0 to finish the flush mechanism. *Note: STOP and FLUSH cannot be set to 1 in the same operation.* 0: Disable 1: Enable

10217C18 **CQ_DMA_G_DMA_CON** **General DMA Control Register** **00000000**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name			**RSIZE**				**WSIZE**					**WRAP_SEL**		**BURST_LEN**		
Type			RW				RW					RW		RW		
Reset			0	0			0	0				0		0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	**WRAP_EN**	**SLOW_CNT**										**RADDR_FIX_EN**	**WADDR_FIX_EN**	**SLOW_EN**	**FIX_EN**	
Type	RW	RW										RW	RW	RW	RW	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

Bit(s)	Name	Description
29:28	RSIZE	**General DMA read size** Only valid when RADDR_FIX_EN = 1. 0: Transaction size is 1 byte. 1: Transaction size is 2 bytes. 2: Transaction size is 4 bytes. 3: Transaction size is 1 byte.
25:24	WSIZE	**General DMA write size** Only valid when WADDR_FIX_EN = 1. 0: Transaction size is 1 byte. 1: Transaction size is 2 bytes. 2: Transaction size is 4 bytes. 3: Transaction size is 1 byte.
20	WRAP_SEL	**Selects general DMA wrap** 0: Read pointer (source)

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Name	Description
		1: Write pointer (destination)
18:16	BURST_LEN	**General DMA burst length** Valid value: 0~7. The best case is to set it to 3(4-8). 0: 1-8 1: 2-8 2: 3-8 3: 4-8 4: 5-8 5: 6-8 6: 7-8 7: 7-8
15	WRAP_EN	**Enables general DMA wrap or double buffer** Its priority is higher than RADDR_FIX_EN or WADDR_FIX_EN. If WRAP_EN=1 and WRAP_SEL=1, WADDR_FIX_EN will not function. If WRAP_EN=1 and WRAP_SEL=0, RADDR_FIX_EN will not function. 0: Disable 1: Enable
14:5	SLOW_CNT	**General DMA slow-down counter** Only slows down the read side; the overall throughput will also be reduced. Supports up to 1,023 cycles. 0: 0 cycle 1: 1 cycle ...
4	RADDR_FIX_EN	**General DMA fixed read address** When FIX_EN=1 or "WRAP_EN=1 and WRAP_SEL=0", this bit will not function. When this function is enabled, note the following limits on DMA: 1. src_addr must be 8-byte aligned. 2. The read transaction size depends on RSIZE. 3. The burst length is always single. 4. dst_addr must not be at EMI. 0: means no fix 1: means fix
3	WADDR_FIX_EN	**General DMA fixed write address** When "WRAP_EN=1 and WRAP_SEL=1", this bit will not function. When this function is enabled, note the following limits on DMA: 1. dst_addr must be 8-byte aligned. 2. The write transaction size depends on WSIZE. 3. The burst length is always single. 4. dst_addr must not be at EMI. 0: means no fix 1: means fix
2	SLOW_EN	**Enables general DMA slow-down** 0: Disable 1: Enable
1	FIX_EN	**General DMA repeat inserting fixed pattern** Its priority is higher than RADDR_FIX_EN, i.e. when FIX_EN=1, RADDR_FIX_EN will be ignored. 0: No use fix pattern 1: Use fix pattern

MEDIATEK CONFIDENTIAL

10217C1C **CQ_DMA_G_DMA_SRC_ADDR** **General DMA Source Address Register** **00000000**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset																0

Bit(s)	Name	Description
0	FLUSH	**Flushes general DMA** Set FLUSH to 1 to stop DMA and allow DMA to flush its internal buffer residual data to the outer memory. After flush is finished, DMA will set EN to 0 to stop DMA. There may still be data not transferred (len may not be 0 after EN = 0).

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Bit(s)	Name	Description
		SW sets FLUSH to 1 and waits for EN to become 0 then set FLUSH back to 0 to finish the flush mechanism. *Note: STOP and FLUSH cannot be set to 1 in the same operation.* 0: Disable 1: Enable

10217D18 **CQ_DMA_G_DMA_1_CON** **General DMA Control Register** **00000000**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name			**RSIZE**				**WSIZE**					**WRAP_SEL**		**BURST_LEN**		
Type			RW				RW					RW		RW		
Reset			0	0			0	0				0		0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	**WRAP_EN**	**SLOW_CNT**										**RADDR_FIX_EN**	**WADDR_FIX_EN**	**SLOW_EN**	**FIX_EN**	
Type	RW	RW										RW	RW	RW	RW	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

Bit(s)	Name	Description
29:28	RSIZE	**General DMA read size** Only valid when RADDR_FIX_EN = 1. 0: Transaction size is 1 byte. 1: Transaction size is 2 bytes. 2: Transaction size is 4 bytes. 3: Transaction size is 1 byte.
25:24	WSIZE	**General DMA write size** Only valid when WADDR_FIX_EN = 1. 0: Transaction size is 1 byte. 1: Transaction size is 2 bytes. 2: Transaction size is 4 bytes. 3: Transaction size is 1 byte.
20	WRAP_SEL	**Selects general DMA wrap** 0: Read pointer (source) 1: Write pointer (destination)
18:16	BURST_LEN	**General DMA burst length** Valid values: 0~7. The best case is set it to 3(4-8). 0: 1-8 1: 2-8 2: 3-8 3: 4-8 4: 5-8 5: 6-8 6: 7-8 7: 7-8
15	WRAP_EN	**Enables general DMA wrap or double buffer** Its priority is higher than RADDR_FIX_EN or WADDR_FIX_EN. If WRAP_EN=1 and WRAP_SEL=1, WADDR_FIX_EN will not function. If WRAP_EN=1 and WRAP_SEL=0, RADDR_FIX_EN will not function. When FIX_EN=1, (if WRAP_EN=1, WRAP_SEL can only be set to 1, and read side cannot be set to wrap 0: Disable 1: Enable

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Name	Description
14:5	SLOW_CNT	**General DMA slow-down counter** Only slows down the read side; the overall throughput will also be reduced. Supports up to 1,023 cycles. 0: 0 cycle 1: 1 cycle ...
4	RADDR_FIX_EN	**General DMA fixed read address** When FIX_EN=1 or "WRAP_EN=1 and WRAP_SEL=0", this bit will not function. When this function is enabled, note the following limits on DMA: 1. src_addr must be 8-byte aligned. 2. The read transaction size depends on RSIZE. 3. The burst length is always single. 4. dst_addr must not be at EMI. 0: No fix 1: Fix
3	WADDR_FIX_EN	**General DMA fixed write address** When "WRAP_EN=1 and WRAP_SEL=1", this bit will not function. When this function is enabled, note the following limits on DMA: 1. dst_addr must be 8-byte aligned. 2. The write transaction size depends on WSIZE. 3. The burst length is always single. 4. dst_addr must not be at EMI. 0: means no fix 1: means fix
2	SLOW_EN	**Enables general DMA slow-down** 0: Disable 1: Enable
1	FIX_EN	**General DMA repeat inserting fixed pattern** Its priority is higher than RADDR_FIX_EN, i.e. when FIX_EN=1, RADDR_FIX_EN will be ignored. 0: No use fix pattern 1: Use fix pattern

10217D1C **CQ_DMA_G_DMA_1_SRC_ADDR** **General DMA Source Address Register** **00000000**

4 Clock and Power Control

4.1 Top Clock Generator

4.1.1 Introduction

This section introduces the top clock generator (TOPCKGEN) and the clock architecture.

4.1.2 Features

TOPCKGEN is responsible for generating the following clock signals:

- Free clock generation for whole chip
- Infrastructure and peripheral system clock, including the top level AXI fabric clock
- Multimedia system clock
- Pad macro clocks to be synchronized with one of the above system

The module TOPCKGEN provides clock source selection. Each clock has several clock source selection and can be turned off as well. When switching certain clock from frequency A to frequency B, make sure frequency A and B are available.

It comprises glitch-free clock MUX and digital clock divider to generate various clock frequencies.

4.1.3 Block Diagram

4.1.3.1 Clock Architecture

There are clock generators not only in the top level hierarchy but also in every partition/system. Figure 4-1 shows the location of the top level clock generator.

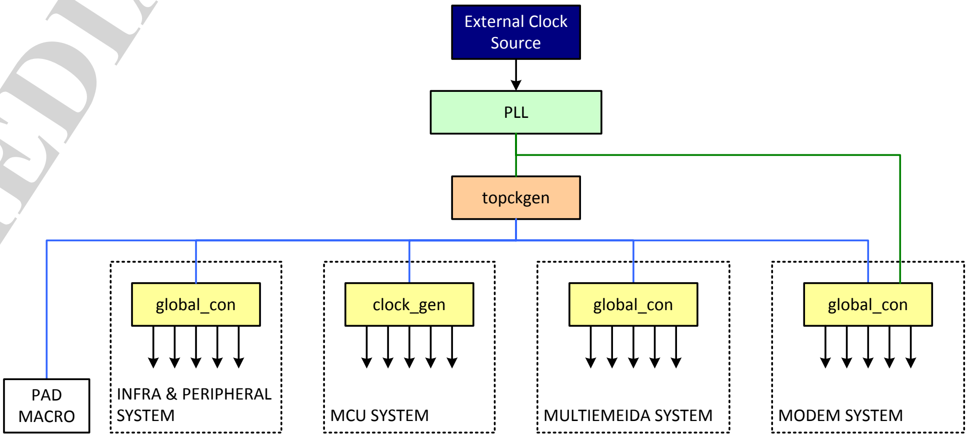

Figure 4-1. Block diagram of clock architecture

MEDIATEK CONFIDENTIAL

4.1.3.2 Clock Multiplixer

Clock selection and generation have similar structure (see Figure 4-2). Several clock sources are provided. Choose one by specified register setting. The turn-off bit is provided as well to stop the clock output.

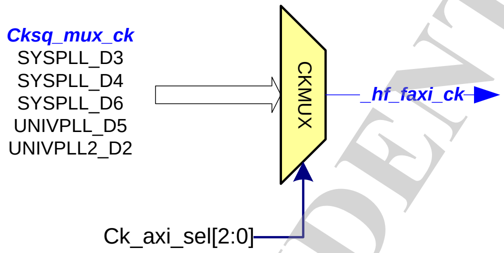

Figure 4-2. Example of clock multiplixer

4.1.5 PLL Related Control

The following table lists all PLLs inside the application system.

The enabling of PLL can be switched between software control and hardware control. The hardware control is from SCPSYS.

The hopping and SSC features can be switched between software control and hardware control. The hardware control is from FHCTL.

Table 4-1. PLL related control

PLL	Capability	Control by FHCTL	Control by SPM
ARMPLL	Hopping, SSC	Y	Y
MAINPLL	Hopping, SSC	Y	Y
UNIVPLL	Fix	N	Y
MSDCPLL	Hopping, SSC	Y	N
MMPLL	Hopping, SSC	Y	N
TVDPLL	Hopping, SSC	Y	N
VENCPLL	Hopping, SSC	Y	N
MEMPLL	Hopping, SSC	Y	Y
MIPIPLL	SSC	N	N
USB20_PHYA	Fix	N	N
APLL1	Hopping, SSC	N	N
WPLL	Fix	By MD	By MD
WHPLL	Hopping, SSC	By MD	By MD
CR4PLL	Hopping, SSC	By MD	By MD
MDPLL	Fix	By MD	By MD
C2KCPPLL	Hopping, SSC	By MD	By MD
C2KDSPPLL	Hopping, SSC	By MD	By MD
MDPLL2_SUB1 (ABB)	Fix	By MD	By MD
MDPLL2_SUB2 (ABB)	Fix	By MD	By MD
LTEDSPPLL	Hopping, SSC	By MD	By MD

4.1.6 Clock Gating

The clock gating for module TOPCKGEN is listed in the table below where DCM and turn-off settings are provided.

Table 4-2. Clock gating settings

Register name	Bit	Default	Function name	Description
CLK_MODE	8	1'b0	pdn_md_32k	Turns off 32K clock source to MD
DCM_CFG	[7]	1'b0	dcm_enable	Enables hf_faxi_ck DCM

© 2014 MediaTek Inc.

This document contains information that is proprietary to MediaTek Inc.

MEDIATEK CONFIDENTIAL

Register name	Bit	Default	Function name	Description
CLK_SCP_CFG_0	[0]	1'b0	sc_26ck_off_en	Turns on scpsys control path to gate 26MHz
	[1]	1'b0	sc_mem_ck_off_en	Turns on scpsys control path to gate DDRPHY
	[2]	1'b0	sc_axick_off_en	Turns on scpsys control path to gate hf_faxi_ck
	[4]	1'b0	sc_armck_off_en	Turns on scpsys control path to gate CA7 hf_farm_ck
	[5]	1'b0	sc_md_32k_off_en	Turns on scpsys control path to gate MD 32KHz
	[9]	1'b0	sc_mac_26m_off_en	Turns on scpsys control path to gate MIPI 26MHz
	[10]	1'b0	sc_armca15ck_off_en	Turns on scpsys control path to gate CA15 hf_farm_ck
CLK_SCP_CFG_1	[0]	1'b0	sc_axi_26m_sel_en	Turns on scpsys control path to switch hf_faxi_ck to 26MHz
	[4]	1'b0	sc_axick_dcm_dis_en	Turns on scpsys control path to disable DCM of hf_faxi_ck

4.1.7 Frequency Meter

There are two frequency meters inside TOPCKGEN. One is for PLLs and TEST clock, called abist_fmeter. The other is for clocks generated from TOPCKGEN, called ckgen_fmeter.
Both structures have PAD output that can observe frequency directly instead of reading results from the frequency meter. Abist_fmeter is outputted to CLKM[0] and ckgen_fmeter is outputted to DEBUG_MON[2].

4.1.9 Programming Guide

4.1.9.1 Clock Off

- The clock can be turned on/off through changing the value of pdn_*. However, this control cannot be switched along with clk_*_sel and clk_*_inv.
- It is recommended to change pdn_* with SET and CLEAR function provided by CLK_CFG_*_SET and CLK_CFG_*_CLR. Because there may be clock with multi-bit pdn_* which are planned to avoid read modify write from different sub-systems (APSYS, MDSYS) at the same time.
- SET and CLEAR function of CLK_CFG_* is a solution to avoid read modify write from different sub-systems.

4.1.9.1.1 Clock Switching

- Make sure clock A and clock B are available before changing the setting of clk_*_sel. If switched to a non-exist clock, the clock switch will be stuck until non-exist clock is turned on to free the clock switch.
- Supports multi-clock switching at the same time (without changing pdn_*)

Switching from clock A to clock B

1. Make sure clock B is ready.
2. Change clk_*_sel.
3. Wait until chg_sta = 1'b0 (optional).
4. Turn off clock A (optional).

4.1.9.1.2 Switch AXI to 26MHz by SCPSYS

The reflection time is about 17T 26MHz if all clocks are counted as 26MHz. Refer to the following formula:

$$4T\ Bus\ Clock_{(*1)} + 4T\ Current\ Clock_{(*2)} + 5T\ Reference\ Clock_{(*3)} + 1T\ Bus\ Clock_{(*4)} + 3T\ Target\ Clock_{(*5)}$$

Comment	Description
Bus clock	26MHz (in current project)
Ref clock	26MHz, balance with bus clock
*1	2T Sync + 1 T Control
*2	3T sync
*3	4T sync
*4	1T control. For async CLKSW like hf_fmem_ck used, it will be 2T sync.
*5	2T sync

4.1.9.1.3 Frequency Meter

There are two frequency meters embedded inside TOPCKGEN.

1. Set fmeter_en to 1'b1.
2. Choose target clock by changing abist_clk_sel/ckgen_clk_sel.
3. Change abist_k1/ckgen_k1 for dividing target clock (optional).
4. Change reference clock by changing clk_exec/ckgen_exec (optional).
5. Change abist_load_cnt/ckgen_load_cnt (optional).
6. Trigger frequency meter by set tri_cal/ckgen_tri_cal = 1b'1.
7. Wait until tri_cal/ckgen_tri_cal = 1'b0.
8. Read frequency meter result from cal_cnt/ckgen_cal_cnt.
    - freq(target) = (abist_k1 + 1)*[freq(reference clock)*cal_cnt]/(abist_load_cnt + 1)
    - freq(target) = (ckgen_k1 + 1)*[freq(reference clock)*ckgen_cal_cnt]/(ckgen_load_cnt + 1)

4.2 Top Reset Generate Unit

4.2.1 Introduction

The top reset generator unit (TOPRGU) generates reset signals and distributes to each system. A watchdog timer is also included in this module.

4.2.2 Features

- Hardware reset signals for the whole chip
- Software controllable reset for each system (except for infrastructure and apmixedsys system)
- Watchdog timer
- Reset output signals for companion chips

4.2.3 Block Diagram

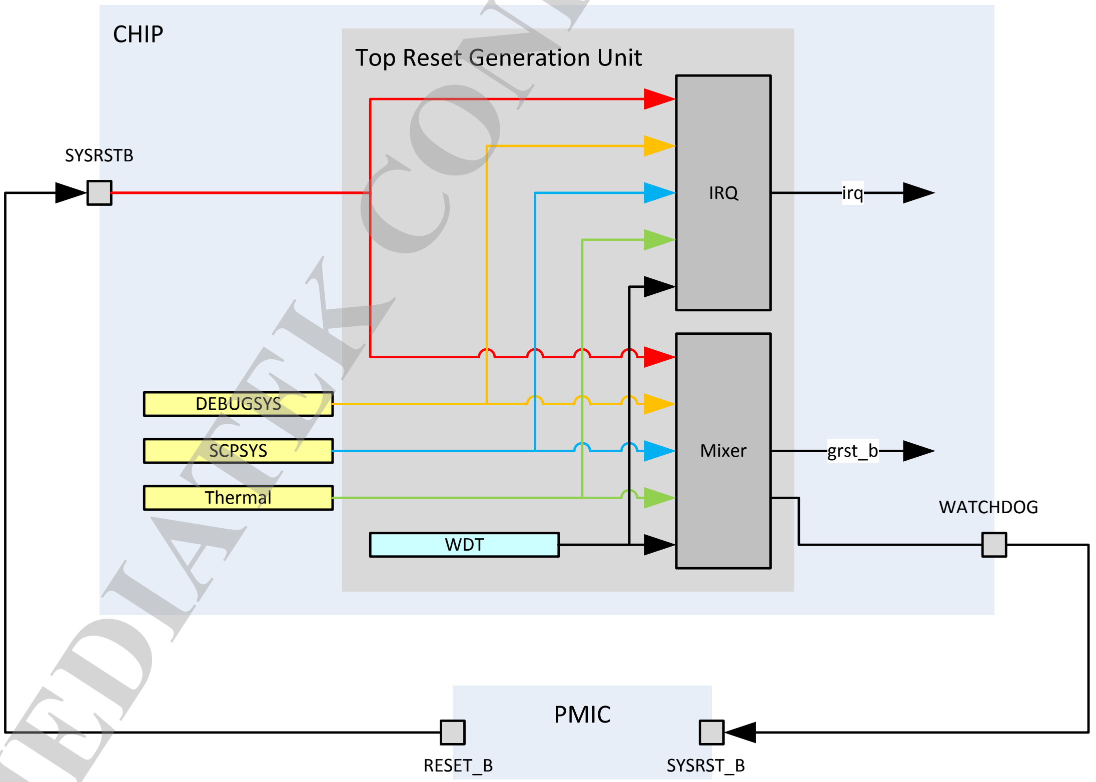

Figure 4-6. Block diagram of top reset generation unit

4.2.5 Programming Guide

4.2.5.1 TOPRGU Initial

Enable dual mode reset when TOPRGU is first initialized. Because WDT_MODE will not be reset and the dual mode will be disabled if system reset is triggered through WDT_SWRST, these registers will only be reset by SYSRSTB.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

The following registers will not be reset by TOPRGU.

- WDT_MODE
- WDT_STA
- WDT_NONRST_REG
- WDT_NONRST_REG2
- WDT_REQ_MODE
- WDT_REQ_IRQ_EN
- WDT_DEBUG_CTL

4.2.5.2 Watchdog Timer

- Trigger WDT_RESTART right after WDT_LENGTH is updated.
- WDT_SWRST can be triggered without wdt_en set to 1'b1.
- It is recommended to trigger WDT_RESTART before setting wdt_en to 1'b1.

4.2.5.3 IRQ Mode

Dual mode reset is default on. Therefore, all reset requests are default with IRQ mode enabled. This means the interrupt is triggered instead of triggering system reset immediately. If you would like to trigger system reset instead of interrupt, change the corresponding configuration of each reset request.

Each reset request can be configured as reset or IRQ separately.

4.2.5.4 MDSYS and CONNSYS Watchdog Timout

MDSYS and CONNSYS have their own watchdog timer. When their watchdog timers expire, they notify AP through interrupts. AP then asserts software reset to MDSYS or CONNSYS.

- MDSYS
  - Enable bus protection to/from MDSYS.
  - Set md_rst = 1'b1.
  - Wait for 2T 32kHz then set md_rst = 1'b0.
  - Disable bus protection to/from MDSYS.
  - Set up MDSYS boot slave.
  - Inform MDSYS abnormal reset via CCIF after MDSYS is ready.

- CONSYS
  - conn_rst = 1'b1
  - Wait for 2T 32kHz then set conn_rst = 1'b0.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

4.2.5.5 Dual Mode Reset

Dual mode reset is system reset after TOPRGU triggers interrupt. The watchdog timer needs to be enabled to complete this function.

In this mode, the watchdog timer will be ***AUTO-RESTART*** after interrupt is triggered. AP needs to clear WDT_STA after receiving interrupt from TOPRGU, or system reset will be triggered after watchdog timer expires.

- Set wdt_en = 1'b1.
- Set dual_mode = 1'b1.
- Set wdt_irq, thermal_irq, scpsys_irq or debug_irq to 1'b1.

4.2.5.6 DDR Protect

DDR protect (rg_ddr_protect_en) is useless when DDR reserved mode is enabled.

4.2.5.7 DDR Reserved Mode Reset

DDR reserved mode keeps data in DDR during system reset. In order to complete this function, DRAMC, DRMC_CONF, DDRPHY_CONF and EMI_CONF (optional) will not be reset.

- Enable DDR reserved mode when initializing TOPRGU.
- Wait for system reset to be triggered.
- [Optional] Check DDR reserved mode status (ddr_reserve_sta).
- After system reset, release DRAMC_CONF protect (set rg_dramc_conf_iso = 1'b0).
- Ensure related clocks of EMI, DRAMC, DDRPHY are ready (including PLL).
- Wait for dramc_sref_sta = 1'b1.
- Release DRAMC protect (set rg_dramc_iso = 1'b0).
- Release DRAMC self-refresh control (set rg_dramc_sref = 1'b0).
- Wait for dramc_sref_sta = 1'b0.

4.2.5.8 History

- EXT RESET is for NAND and PMIC, but there is exception.
  - MT6329 needs to disable WDT_MODE[2].
- WDT_LENGTH needs to be reset, or SYSTEM will enter RESET loop if WDT_LENGTH has been set to very short before reset trigger.

4.3 PMIC Wrapper

4.3.1 Introduction

The PMIC wrapper is the bridge for communication between AP and PMIC.

4.3.2 Features

- Fast auto SPI format generator for PMIC register read/write
- APB3.0 bus lock scheme when SPI is busy
- Manual SPI format generator
- Supports access to dual PMICs
- Single and dual I/O SPI mode support for PMIC
- Single IO mode support only for Switching Charger
- Separated frequency between controller and SPI

1000101C CSHEXT_READ CS High Extension - Read 0F

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									CSHEXT_READ							
Type									RW							
Reset									0	0	0	0	1	1	1	1

Bit(s)	Name	Description
7:0	CSHEXT_READ	**After finishing a read transaction, extends CS high time to be at least (1+CSHEXT_READ[3:0])T of SPI CLK** Applied to the CS high time between ADR and DATA of a read transaction.

10001020 CSLEXT_START CS Low Extension - Start 0F

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													CSLEXT_START			
Type													RW			
Reset													1	1	1	1

Bit(s)	Name	Description
3:0	CSLEXT_START	Extends CS low time after CSL command to be at least (1.5+CSLEXT_START[3:0])T of SPI CLK

10001024 CSLEXT_END CS Low Extension - End 0F

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													CSLEXT_END			
Type													RW			
Reset													1	1	1	1

Bit(s)	Name	Description
3:0	CSLEXT_END	Extends CS low time before CSH command to be at least (1.5+CSLEXT_END[3:0])T of SPI CLK

10001028 STAUPD_PRD Status Update Control Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													STAUPD_PRD			
Type													RW			
Reset													0	0	0	0

Bit(s)	Name	Description
3:0	STAUPD_PRD	**Selects periodic status update timing (period)** This status will be updated every selected time period. Unit: 19.7us 0: Disable 1: 19.7us

4.4 Frequency Hopping Controller

4.4.1 Introduction

The frequency hopping controller helps AP resolve de-sense issues. The RF victims are 2G/3G/BT/FM/WiFi/GPS, etc. The aggressors in AP is the clock generated from PLL in ABB. The harmonic of all clock frequencies may de-sense the band of RF system.

4.4.2 Features

The frequency hopping controller receives the command from CPU to trigger two mechanisms:

- Spread spectrum clocking
- Frequency hopping

In MT6735, there are 7 hopping PLLs:

NAME	Capability	Range
ARMPLL	hopping, SSC	{-8%,0}
MAINPLL	hopping, SSC	{-8%,0}
MEMPLL	hopping, SSC	{-8%,0}
MMPLL	hopping, SSC	{-8%,0}
VENCPLL	SSC	{-4%,0}
MSDCPLL	hopping, SSC	{-8%,0}
TVDPLL	SSC	{-8%,0}

4.4.3 Block Diagram

Whenever MCUSYS enters sleep mode, SRCLKENA from the sleep controller is de-asserted. SRCLKENA from MCUSYS controls the power supply for the 13MHz/26MHz TCVCXO via the on-chip PMU. When the signal is de-asserted, LDO for TCVCXO in the PMU will be turned off, and 13MHz/26MHz clock will stop.

5 Peripherals

5.1 Pericfg Controller

5.1.1 Introduction

The pericfg controller is used to control the reset, clock and bus setting of peripheral subsys. Each module inside the peripheral subsys has its own software reset and clock gated control (power-down control). The hardware DCM (Dynamic Clock Management) of the peripheral subsys is also controlled in the pericfg controller. Beside AP MCU, the modem MCU can also use this pericfg controller to control specific modules clock gated control (power-down control).

5.1.2 Features

- Supports software reset control of each module inside peripheral subsys
- Supports clock gated control of the modules insider peripheral subsys by AP MCU
- Supports clock gated control of the modules insider peripheral subsys by Modem1 MCU
- Supports clock gated control of the modules insider peripheral subsys by Modem2 MCU
- Supports DCM control of peripheral subsys
- Supports bus setting (bandwidth limit/way enable/...) of peripheral subsys

5.1.3 Block Diagram

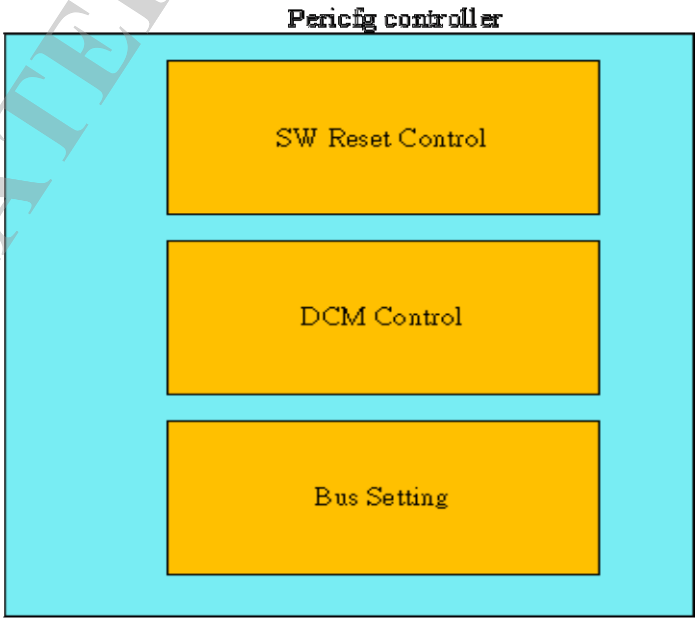

Figure 5-1. Block diagram of pericfg controller

Reset	1	1	1	1	0	0	0	0	0	0	0	0	0	1	0	0

Bit(s)	Mnemonic	Name	Description
27	PERI_X2H_BUFFER_EN	PERI_X2H_BUFFER_EN	**Enables AXI2AHB buffer attribute** 1: bvalid will be active as soon as all write data arrive at AXI2AHB bridge. 0: bvalid will be active only when all data are transferred to AHB.
26	PERI_X2H_BURST_EN	PERI_X2H_BURST_EN	**Enables AXI2AHB burst attribute** 0: The time when rvalid starts to toggle depends on arthre. 1: rvalid will start to toggle only when all AXI read data are received from AHB domain.
25	PERI_X2H_ARMSK_B	PERI_X2H_ARMSK_B	**In AXI2AHB bridge, if AXI read channel issues an INCR burst command with unaligned address, by default the bridge will use a mask circuit to make the address aligned. This will result in reading extra data from AHB slave.** If reading extra data from AHB slave will harm your application, you can set this bit to 1 to avoid this. armsk_b means the read mask circuit is low active. 1: Disable mask circuit; will not read extra data from AHB slave 0: Enable mask circuit; will result in reading extra data from AHB slave
24:22	PERI_X2H_HBURST	PERI_X2H_HBURST	**to decide the maximum burst type for AHB. Only effective when AXI issues the INCR burst type** 0: Only single transaction in AHB domain 3: Max. AHB burst will be INCR4. 5: Max. AHB burst will be INCR8. 7: Max. AHB burst will be INCR16. Otherwise: Will not take effect
21:12	PERI_HDEC_WAY_EN	PERI_HDEC_WAY_EN	**Enables slave way to bus mux**
11:10	PERI_X2S_THRES	PERI_X2S_THRES	**Configures how many data are latched before sending command on sbus.**
9:5	peri_s2f_depth_val	peri_s2f_depth_val	**Read flow control threshold setting; only valid when peri_s2f_ar_fctrl_en == 1**
4	peri_s2f_ar_fctrl_en	peri_s2f_ar_fctrl_en	**Selects read channel flow control method** 0: Threshold is pending read transaction number. 1: Threshold is pending read data number.
3	peri_s2f_aw_fctrl_en	peri_s2f_aw_fctrl_en	**Enables write channel flow control** 0: Disable write channel flow control 1: Enable write channel flow control
2:0	peri_s2f_wthre	peri_s2f_wthre	**Write flow control threshold setting** 0: Threshold is 1. 1: Threshold is 1/4 write data FIFO depth. 2: Threshold is 1/2 write data FIFO depth. 3: Threshold is 3/4 write data FIFO depth. 4: Threshold is write data FIFO depth. Otherwise: Threshold is write data FIFO depth.

5.2 GPIO Control

5.2.1 General Descriptions

There are 198 I/O pins which can be programmed as multiple purpose, including GPIO, NAND, SPI, etc. By setting up the GPIO_MODE register, specific IO is selected for specific function.

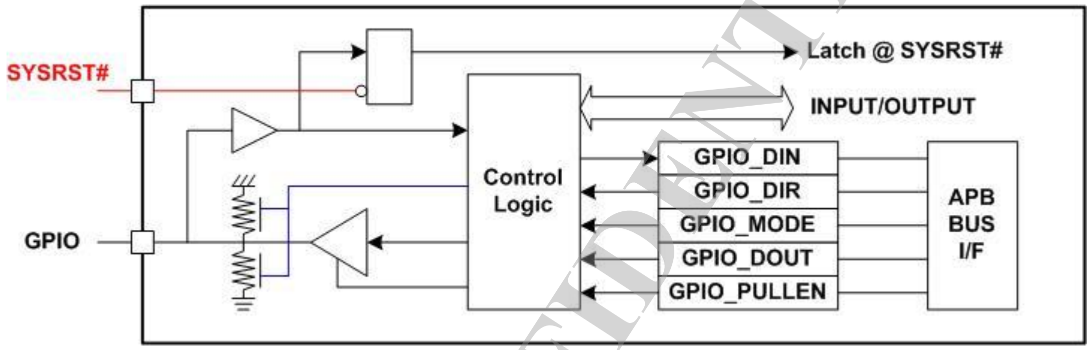

Figure 5-2. GPIO block diagram

All functions should comply with the priority rule. When there are more than one IO set as the same output function, all of the selected IOs are able to output specific signals. When there are more than one IO are set as the same input (or bi-directional) function, only the IO with the largest GPIO index works functionally.

When the MIPI function is not used, related IOs can be switched to non-MIPI input-only function, like EINT. To enable the GPI function of MIPI, there are some configurations to be done before the related GPIO_MODE is set.

5.2.2 Register Definition

Module name: GPIO Base address: (+10211000h)

Address	Name	Width	Register Function
10211000	GPIO_DIR1	32	GPIO Direction Control Register 1

5.3 Keypad Scanner

5.3.1 General Description

The keypad supports two types of keypads: 8*8 single keys and 3*3 configurable double keys.

The 8*8 keypad can be divided into two parts: 1) The keypad interface including 8 columns and 8 rows (see Figure 5-3 and Figure 5-4). The key detection block provides key pressed, key released and de-bounce mechanisms.

Each time the key is pressed or released, i.e. something different in the 8x8 matrix, the key detection block senses the change and recognizes if a key has been pressed or released. Whenever the key status changes and is stable, a KEYPAD IRQ will be issued. The MCU can then read the key(s) pressed directly in the KP_MEM1, KP_MEM2, KP_MEM3, KP_MEM4 and KP_MEM5 registers. To ensure the key pressed information is not missed, the status register in keypad will not be read-cleared by the APB read command. The status register can only be changed by the key-pressed detection FSM.

This keypad detects one or two keys pressed simultaneously with any combination. **Figure** 5-7 shows the one key pressed condition. **Figure** 5-8 (a) and **Figure** 5-8 (b) illustrate the cases of two keys pressed. Since the key pressed detection depends on the HIGH or LOW level of the external keypad interface, if the keys are pressed at the same time, and there exists a key that is on the same column and the same row with other keys, the pressed key cannot be correctly decoded. For example, if there are three key pressed: key1 = (x1, y1), key2 = (x2, y2), and key3 = (x1, y2), both key3 and key4 = (x2, y1) will be detected, and therefore they cannot be distinguished correctly. Hence, the keypad detects only one or two keys pressed simultaneously in any combination. More than two keys pressed simultaneously in a specific pattern will retrieve the wrong information.

The 3*3 keypad supports a 3*3*2 = 18 keys matrix. The 18 keys are divided into 9 sub groups, and each group consists of 2 keys and a 20 ohm resistor. Besides the limitation of the 8*8 keypad, 3*3 keypad has another limitation, which is it cannot detect two keys pressed simultaneously when the two keys are in one group, i.e. the 3*3 keypad cannot detect key 0 and key 1 pressed simultaneously or key 14 and key 15 pressed simultaneously.

5.3.3 Register Definition

Module name: kp Base address: (+10003000h)

Address	Name	Width	Register Function
10003000	KP_STA	16	**Keypad Status**
10003004	KP_MEM1	16	**Keypad Scanning Output Register** Shows the key-pressed status of key 0 (LSB) ~ key 15. Refer to Table 5-1 and Table 5-2.
10003008	KP_MEM2	16	**Keypad Scanning Output Register** Shows the key-pressed status of key 16 (LSB) ~ key 31. Refer to Table 5-1 and Table 5-2.
1000300C	KP_MEM3	16	**Keypad Scanning Output Register** Shows the key-pressed status of key 32 (LSB) ~ key 47. Refer to Table 5-1 and Table 5-2.
10003010	KP_MEM4	16	**Keypad Scanning Output Register** Shows the key-pressed status of key 48 (LSB) ~ key 63. Refer to Table 5-1 and Table 5-2.
10003014	KP_MEM5	16	**Keypad Scanning Output Register** Shows the key-pressed status of key 64 (LSB) ~ key 77. Refer to Table 5-1 and Table 5-2.
10003018	KP_DEBOUNCE	16	**De-bounce Period Setting** Defines the waiting period before key pressing or release events are considered stable. If the de-bounce setting is too small, the keypad will be too sensitive and detect too many unexpected key presses. The suitable de-bounce time setting must be adjusted according to the user's habit.
1000301C	KP_SCAN_TIMING	16	**Keypad Scan Timing Adjustment Register** Sets up the 3*3 keypad scan timing. *Note: ROW_SCAN_DIV > ROW_INTERVAL_DIV and COL_SCAN_DIV > COL_INTERVAL_DIV.* ROW_INTERVAL_DIV/COL_INTERVAL_DIV are used to lower

10003018 KP_DEBOUNCE De-bounce Period Setting 0400

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name			DEBOUNCE													
Type			RW													
Reset			0	0	0	1	0	0	0	0	0	0	0	0	0	0

Overview Defines the waiting period before key pressing or release events are considered stable. If the de-bounce setting is too small, the keypad will be too sensitive and detect too many unexpected key presses. The suitable de-bounce time setting must be adjusted according to the user's habit.

Bit(s)	Mnemonic	Name	Description
13:0	**DEBOUNCE**	DEBOUNCE	De-bounce time = KP_DEBOUNCE/32 ms

1000301C KP_SCAN_TIMING Keypad Scan Timing Adjustment Register 0011

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	COL_INTERVAL_DIV				ROW_INTERVAL_DIV				COL_SCAN_DIV				ROW_SCAN_DIV			
Type	RW				RW				RW				RW			
Reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1

Overview Sets up the 3*3 keypad scan timing. Note: ROW_SCAN_DIV > ROW_INTERVAL_DIV and COL_SCAN_DIV > COL_INTERVAL_DIV. ROW_INTERVAL_DIV/COL_INTERVAL_DIV are used to lower the power consumption for it decreases the actual scan number during the de-bounce time.

Bit(s)	Mnemonic	Name	Description
15:12	**COL_INTERVAL_DIV**	COL_INTERVAL_DIV	**Sets up the COL SCAN interval cycle, i.e. cycles between two scans** Default 0 means there is 1 cycle between two high scan pulses.
11:8	**ROW_INTERVAL_DIV**	ROW_INTERVAL_DIV	**Sets up the ROW SCAN interval cycle, i.e. cycles between two scans** Default 0 means there is 1 cycle between two high scan pulses.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Bit(s)	Mnemonic	Name	Description
7:4	COL_SCAN_DIV	COL_SCAN_DIV	**Sets up the COL SCAN cycle which includes COL_INTERVAL_DIV and the high pulse period** Default 1 means there are 2 cycles for each scan, including 1 cycle high pulse and 1 cycle interval.
3:0	ROW_SCAN_DIV	ROW_SCAN_DIV	**Sets up the ROW SCAN cycle which includes ROW_INTERVAL_DIV and the high pulse period** Default 1 means there are 2 cycles for each scan, including 1 cycle high pulse and 1 cycle interval.

5.4 UART

5.4.1 Introduction

The baseband chipset houses four UARTs. UARTs provide full duplex serial communication channels between the baseband chipset and external devices.

UART has both M16C450 and M16550A modes of operation, which are compatible with a range of standard software drivers. The extensions are designed to be broadly software compatible with 16550A variants, but certain areas offer no consensus.

In common with M16550A, the UART supports word lengths from 5 to 8 bits, an optional parity bit and one or two stop bits and is fully programmable by an 8-bit CPU interface. A 16-bit programmable baud rate generator and an 8-bit scratch register are included, together with separate transmit and receive FIFOs. Two modem control lines and a diagnostic loop-back mode are provided. UART also includes two DMA handshake lines, indicating when the FIFOs are ready to transfer data to the CPU. Interrupts can be generated from any of the ten sources.

Note that UART is designed so that all internal operation is synchronized by the CLK signal. This synchronization results in minor timing differences between the UART and industry standard 16550A device, which means that the core is not clock for clock identical to the original device.

After hardware reset, UART will be in M16C450 mode; its FIFOs can then be enabled and UART can enter M16550A mode. UART has further additional functions beyond the M16550A mode. Each of the extended functions can be selected individually under software control.

UART provides more powerful enhancements than the industry-standard 16550:

Hardware flow control
This feature is very useful when the ISR latency is hard to predict and control in the embedded applications. The MCU is relieved of having to fetch the received data within a fixed amount of time.

Note that in order to enable the enhancements, the enhanced mode bit, EFR[4], must be set. If EFR[4] is not set, IER[7:4], FCR[5:4], cannot be written and MCR[7] cannot be read. The enhanced mode bit ensures that UART is backward compatible with the software that has been written for 16C450 and 16550A devices.

5.4.2 Features

- Provides 4 channels
- DMA, polling or interrupt operation
- Supports word lengths from 5 to 8 bits, with an optional parity bit and one or two stop bits
- 4 UART ports for hardware automatic flow control (UART0, UART1, UART2, UART3)
- Supports baud rates from 110bps up to 961,200bps
- Baud rate auto detection function

5.4.3 Block Diagram

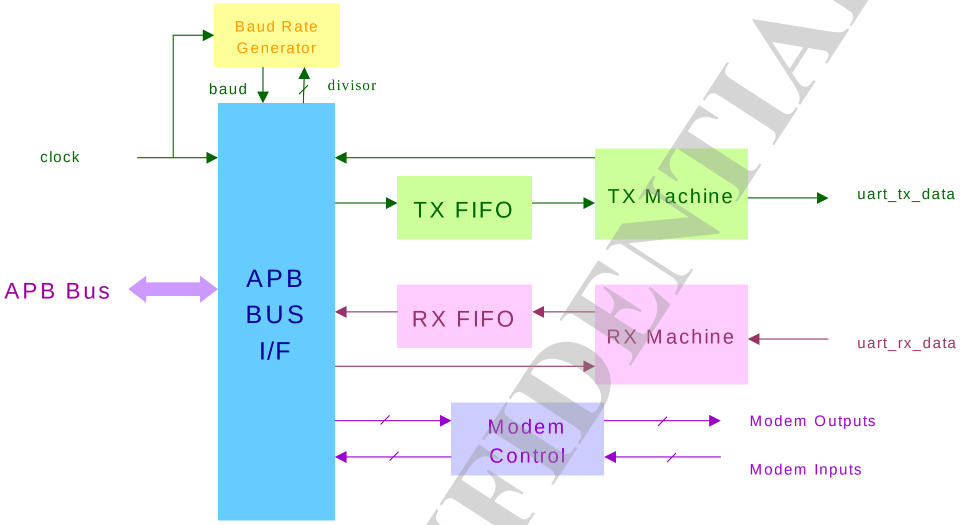

Figure 5-9. Block diagram of UART

5.4.4 Register Definition

UART number	Base address	Feature
UART0	0x11002000	Supports DMA, HW flow control
UART1	0x11003000	Supports DMA, HW flow control
UART2	0x11004000	Supports DMA, HW flow control
UART3	0x11005000	Supports DMA, HW flow control
UART4	0x1100D000	Supports DMA, HW flow control

There are five UART IPs in this SOC. The usage of the registers below are the same except that the base address must be changed to respective one.

Module name: uart1 Base address: (+11003000h)

Address	Name	Width	Register Function
11003000	**RBR**	8	RX Buffer Register
11003000	**THR**	8	TX Holding Register
11003004	**IER**	8	**Interrupt Enable Register** By storing 1 to a specific bit position, the interrupt associated with that bit is enabled. Otherwise, the interrupt is disabled. IER[7:4] are modified when EFR[4] = 1.
11003008	**IIR**	8	**Interrupt Identification Register** The priority is from high to low as the following: IIR[5:0]=0X1: No interrupt pending IIR[5:0]=0X6: Line status interrupt (under IER[2]=1) IIR[5:0]=0Xc: RX data timeout interrupt (under IER[0]=1) IIR[5:0]=0X4: RX data are placed in the RX buffer register or the RX trigger level is reached (under IER[0]=1). IIR[5:0]=0X2: TX holding register is empty or the contents of TX

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Address	Name	Width	Register Function
			FIFO have been reduced to its trigger level (under IER[1]=1). IIR[5:0]=0X0: Modem status change interrupt (under IER[3]=1) IIR[5:0]=0X10: XOFF character received (under IER[5]=1,EFR[4] = 1) IIR[5:0]=0X20: CTS or RTS rising edge (under IER[7]=1, IER[6]=1, EFR[4] = 1)
11003008	FCR	8	**FIFO Control Register** FCR is used to control the trigger levels of FIFOs or flush FIFOs. FCR[5:4] is modified when EFR[4] = 1.
1100300C	LCR	8	**Line Control Register** Determines characteristics of serial communication signals.
11003010	MCR	8	**Modem Control Register** Controls interface signals of UART. MCR[7] can be read when EFR[4] = 1.
11003014	LSR	8	**Line Status Register** Line status register
11003018	MSR	8	**Modem Status Register** Note: After a reset, D4-D7 will be inputs. A modem status interrupt can be cleared by writing 0 to D0-D3 or reading this register and set by writing 1 to D0-D3 or input has changed. D0-D3 can be modified when != BFh.
1100301C	SCR	8	**Scratch Register** General purpose read/write register After reset, its value will be un-defined.
11003020	AUTOBAUD_EN	8	Auto Baud Detect Enable Register
11003024	HIGHSPEED	8	High Speed Mode Register
11003028	SAMPLE_COUNT	8	**Sample Counter Register** When HIGHSPEED=3, sample_count is the threshold value for UART sample counter (sample_num). Count from 0 to sample_count.
1100302C	SAMPLE_POINT	8	**Sample Point Register** When HIGHSPEED=3, UART gets the input data when sample_count=sample_num. e.g. system clock = 13MHz, 921600 = 13000000/14 sample_count = 13 and sample point = 6 (sample the central point to decrease the inaccuracy) SAMPLE_POINT is usually (SAMPLE_COUNT-1)/2 with decimal removed.
11003030	AUTOBAUD_REG	8	**Auto Baud Monitor Register** Autobaud detection state Will not change until autobaud_en is enabled again.
11003034	RATEFIX_AD	8	**Clock Rate Fix Register**
11003038	AUTOBAUDSAMPLE	8	**Auto Baud Sample Register** Since the system clock may change, autobaud sample duration should change as system clock changes. When system clock = 13MHz, autobaudsample = 6; when system clock = 26MHz, autobaudsample = 13; when system clock = 52MHz, autobaudsample = 27.
1100303C	GUARD	8	Guard Time Added Register
11003040	ESCAPE_DAT	8	Escape Character Register
11003044	ESCAPE_EN	8	Escape Enable Register
11003048	SLEEP_EN	8	Sleep Enable Register
1100304C	DMA_EN	8	DMA Enable Register
11003050	RXTRI_AD	8	RX Trigger Address
11003054	FRACDIV_L	8	Fractional Divider LSB Address
11003058	FRACDIV_M	8	Fractional Divider MSB Address

Bit(s)	Name	Description
		Timeout on character in RX FIFO. (Under IER[0]=1) 000100 3 RX Data Received: RX Data received or RX Trigger Level reached. (Under IER[0]=1) 000010 4 TX Holding Register Empty: TX Holding Register empty or TX FIFO Trigger Level reached. (Under IER[1]=1) 000000 5 Modem Status change: DDCD, TERI, DDSR or DCTS set in MSR. (Under IER[3]=1) 010000 6 Software Flow Control: XOFF Character received. (Under IER[5]=1) 100000 7 Hardware Flow Control: CTS or RTS Rising Edge. (Under IER[7]=1 or IER[6]=1) Line Status Interrupt: A RX Line Status Interrupt (IIR[5:0] == 000110b) is generated if ELSI (IER[2]) is set and any of BI, FE, PE or OE (LSR[4:1]) becomes set. The interrupt is cleared by reading the Line Status Register. RX Data Timeout Interrupt:When virtual FIFO mode is disabled, RX Data Timeout Interrupt is generated if all of the following apply: 1. FIFO contains at least one character; 2. The most recent character was received longer than four character periods ago (including all start, parity and stop bits); 3. The most recent CPU read of the FIFO was longer than four character periods ago. The timeout timer is restarted on receipt of a new byte from the RX Shift Register, or on a CPU read from the RX FIFO. The RX Data Timeout Interrupt is enabled by setting EFRBI (IER[0]) to 1, and is cleared by reading RX FIFO. When virtual FIFO mode is enabled, RX Data Timeout Interrupt is generated if all of the following apply: 1. FIFO is empty; 2. The most recent character was received longer than four character periods ago (including all start, parity and stop bits); 3. The most recent CPU read of the FIFO was longer than four character periods ago. The timeout timer is restarted on receipt of a new byte from the RX Shift Register or reading DMA_EN register. The RX Data Timeout Interrupt is enabled by setting EFRBI (IER[0]) to 1, and is cleared by reading DMA_EN register. RX Data Received Interrupt: A RX Received interrupt (IER[5:0] == 000100b) is generated if EFRBI (IER[0]) is set and either RX Data is placed in the RX Buffer Register or the RX Trigger Level is reached. The interrupt is cleared by reading the RX Buffer Register or the RX FIFO (if enabled). TX Holding Register Empty Interrupt: A TX Holding Register Empty Interrupt (IIR[5:0] = 000010b) is generated if ETRBI (IER[1]) is set and either the TX Holding Register is empty or the contents of the TX FIFO have been reduced to its Trigger Level. The interrupt is cleared by writing to the TX Holding Register or TX FIFO if FIFO enabled. Modem Status Change Interrupt: A Modem Status Change Interrupt (IIR[5:0] = 000000b) is generated if EDSSI (IER[3]) is set and either DDCD, TERI, DDSR or DCTS (MSR[3:0]) becomes set. The interrupt is cleared by reading the Modem Status Register. Software Flow Control Interrupt: A Software Flow Control Interrupt (IIR[5:0] = 010000b) is generated if Software Flow Control is enabled and XOFFI (IER[5]) becomes set, indicating that an XOFF character has been received. The interrupt is cleared by reading the Interrupt Identification Register. Hardware Flow Control Interrupt: A Hardware Flow Control Interrupt (IER[5:0] = 100000b) is generated if Hardware Flow Control is enabled and

MEDIATEK CONFIDENTIAL

Bit(s)	Name	Description
		either RTSI (IER[6]) or CTSI (IER[7]) becomes set indicating that a rising edge has been detected on either the RTS/CTS Modem Control line. The interrupt is cleared by reading the Interrupt Identification Register.

11003008 FCR FIFO Control Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									RFTL1_RFTL0		TFTL1_TFTL0			CLRT	CLRR	FIFOE
Type									WO		WO			WO	WO	WO
Reset									0	0	0	0		0	0	0

Bit(s)	Name	Description
7:6	RFTL1_RFTL0	**RX FIFO trigger threshold** RX FIFO contains total 32 bytes. 0: 1 1: 6 2: 12 3: RXTRIG
5:4	TFTL1_TFTL0	**TX FIFO trigger threshold** TX FIFO contains total 32 bytes. 0: 1 1: 4 2: 8 3: 14
2	CLRT	**Control bit to clear TX FIFO** 0: No effect 1: Clear TX FIFO
1	CLRR	**Control bit to clear RX FIFO** 0: No effect 1: Clear RX FIFO
0	FIFOE	**Enables FIFO** This bit must be set to 1 for any of other bits in the registers to take effect. 0: Disable both RX and TX FIFO 1: Enable both RX and TX FIFO

1100300C LCR Line Control Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									DLAB	SB	SP	EPS	PEN	STB	WLS1_WLS0	
Type									RW	RW	RW	RW	RW	RW	RW	
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7	DLAB	**Divisor latch access bit** 0: RX and TX registers are read/written at Address 0 and IER register is read/written at Address 4. 1: Divisor Latch LS is read/written at Address 0 and the Divisor Latch MS is read/written at Address 4.
6	SB	**Sets up break** 0: No effect 1: SOUT signal is forced to "0" state.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Bit(s)	Name	Description
5	SP	**Stick parity** 0: No effect. 1: The parity bit is forced to a defined state, depending on the states of EPS and PEN: If EPS=1 & PEN=1, the parity bit will be set and checked=0. If EPS=0 & PEN=1, the Parity bit will be set and checked=1.
4	EPS	**Selects even parity** 0: When EPS=0, an odd number of ones is sent and checked. 1: When EPS=1, an even number of ones is sent and checked.
3	PEN	**Enables parity** 0: The parity is neither transmitted nor checked. 1: The parity is transmitted and checked.
2	STB	**Number of STOP bits** 0: One STOP bit is always added. 1: Two STOP bits are added after each character is sent; unless the character length is 5 when 1 STOP bit is added.
1:0	WLS1_WLS0	**Selects word length** 0: 5 bits 1: 6 bits 2: 7 bits 3: 8 bits

11003010 MCR Modem Control Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									XOFF_STATUS			Loop			RTS	
Type									RU			RW			RW	
Reset									0			0			0	

Bit(s)	Name	Description
7	XOFF_STATUS	**Read-only** 0: When an XON character is received. 1: When an XOFF character is received.
4	Loop	**Loop-back control bit** 0: No loop-back is enabled. 1: Loop-back mode is enabled.
1	RTS	**Controls the state of the output NRTS, even in loop mode** 0: RTS always outputs 1. 1: RTSs output is controlled by flow control condition.

11003014 LSR Line Status Register 60

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									FIFOERR	TEMT	THRE	BI	FE	PE	OE	DR
Type									RU	RU	RU	RU	RU	RU	RU	RU
Reset									0	1	1	0	0	0	0	0

Bit(s)	Name	Description
7	FIFOERR	**RX FIFO error indicator** 0: No PE, FE and BI is in RX FIFO.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Name	Description
		1: Set to 1 when there is at least one PE, FE or BI in RX FIFO.
6	TEMT	**TX holding register (or TX FIFO) and TX shift register are empty.** 0: Empty conditions below are not met. 1: If FIFOs are enabled, the bit will be set whenever TX FIFO and the TX shift register are empty. If FIFOs are disabled, the bit will be set whenever TX holding register and TX shift register are empty.
5	THRE	**Indicates if there is room for TX Holding Register or TX FIFO is reduced to its trigger level** 0: Reset whenever the contents of TX FIFO are more than its trigger level (FIFOs are enabled), or whenever TX holding register is not empty (FIFOs are disabled). 1: Set whenever the contents of TX FIFO are reduced to its trigger level (FIFOs are enabled), or whenever TX holding register is empty and ready to accept new data (FIFOs are disabled).
4	BI	**Break interrupt** 0: Reset by CPU reading this register 1: If FIFOs are disabled, this bit will be set whenever SIN is held in 0 state for more than one transmission time (START bit + DATA bits + PARITY + STOP bits). If FIFOs are enabled, this error will be associated with a corresponding character in FIFO and is flagged when this byte is at top of FIFO. When a break occurs, only one zero character will be loaded to the FIFO: The next character transfer will be enabled when SIN enters the marking state and receives the next valid start bit.
3	FE	**Framing error** 0: Reset by CPU reading this register 1: If the FIFOs are disabled, this bit will be set if the received data do not have a valid STOP bit. If FIFOs are enabled, the state of this bit will be revealed when the byte it refers to is the next to be read.
2	PE	**Parity error** 0: Reset by CPU reading this register 1: If FIFOs are disabled, this bit will be set if the received data do not have a valid parity bit. If FIFOs are enabled, the state of this bit will be revealed when the referred byte is the next to be read.
1	OE	**Overrun error** 0: Reset by CPU reading this register. 1: If FIFOs are disabled, this bit will be set if RX buffer is not read by CPU before new data from RX shift register overwrites the previous contents. If FIFOs are enabled, an overrun error will occur when RX FIFO is full and RX shift register becomes full. OE is set as soon as this happens. The character in the shift register will then be overwritten but not transferred to the FIFO.
0	DR	**Data ready** 0: Cleared by CPU reading RX buffer or by reading all FIFO bytes. 1: Set by RX buffer becoming full or by FIFO becoming not empty.

11003018 MSR Modem Status Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name												CTS				DCTS
Type												RU				RW
Reset												0				0

Bit(s)	Name	Description
4	CTS	**Clear to send** When Loop = "0", this value is the complement of the NCTS input signal. When Loop = "1", this value is equal to the RTS bit in the modem control

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Name	Description
		register.
0	DCTS	**Delta clear to send** 0: Cleared if the state of CTS has not changed since this register is last read. 1: Set if the state of CTS has changed since this register is last read.

1100301C SCR Scratch Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									SCR							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	SCR	**General purpose read/write register** After reset, its value will be undefined.

11003020 AUTOBAUD_EN Auto Baud Detect Enable Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name														sleep_ack_sel	AUTOBAUD_SEL	AUTOBAUD_EN
Type														RW	RW	RW
Reset														0	0	0

Bit(s)	Name	Description
2	sleep_ack_sel	0: Send sleep_ack when autobaud_en is enabled and autobaud state machine and RX are idle . 1: Cannot send sleep_ack when autobaud_en is enabled .
1	AUTOBAUD_SEL	**Selects auto-baud** 0: Support standard baud rate detection 1: Support non_standard baud rate detection (only baud from 300 to 115,200; using 52MHz to auto fix is recommended)
0	AUTOBAUD_EN	**Auto-baud enable signal** 0: Disable auto-baud function 1: Enable auto-baud function (UARTn+0024h SPEED should be set 0) *Note: When AUTOBAUD_EN is active, there should not be A*/a* char before auto baud char AT/at. If A*/a* is inevitable, autobaud will fail and please disable AUTOBAUD_EN to reset autobaud feature and autobaud_en.*

11003024 HIGHSPEED High Speed Mode Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name															SPEED	
Type															RW	
Reset															0	0

Bit(s)	Name	Description

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Bit(s)	Name	Description
1:0	SPEED	**UART sample counter base** 0: Based on 16*baud_pulse, baud_rate = system clock frequency/16/{DLH, DLL} 1: Based on 8*baud_pulse, baud_rate = system clock frequency/8/{DLH, DLL} 2: based on 4*baud_pulse, baud_rate = system clock frequency/4/{DLH, DLL} 3: Based on sampe_count*baud_pulse, baud_rate = system clock frequency/(sampe_count+1)/{DLM, DLL}

11003028 **SAMPLE_COUNT** **Sample Counter Register** **00**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									**SAMPLECOUNT**							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	SAMPLECOUNT	Only useful when HIGHSPEED mode=3

1100302C **SAMPLE_POINT** **Sample Point Register** **FF**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									**SAMPLEPOINT**							
Type									RW							
Reset									1	1	1	1	1	1	1	1

Bit(s)	Name	Description
7:0	SAMPLEPOINT	**SAMPLE_POINT is usually (SAMPLE_COUNT-1)/2 without decimal.** Sample point is effective only when HIGHSPEED=3.

11003030 **AUTOBAUD_REG** **Auto Baud Monitor Register** **00**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									**BAUD_STAT**				**BAUD_RATE**			
Type									RU				RU			
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:4	BAUD_STAT	**Autobaud format** 0: Autobaud is detecting. 1: AT_7N1 2: AT_7O1 3: AT_7E1 4: AT_8N1 5: AT_8O1 6: AT_8E1

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Bit(s)	Name	Description
		7: at_7N1 8: at_7E1 9: at_7O1 10: at_8N1 11: at_8E1 12: at_8O1 13: Autobaud detection fails.
3:0	BAUD_RATE	**Autobaud baud rate** 0: 115200 1: 57600 2: 38400 3: 19200 4: 9600 5: 4800 6: 2400 7: 1200 8: 300 9: 110

11003034 RATEFIX_AD Clock Rate Fix Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name														**FREQ_SEL**	**AUTOBAUD_RATE_FIX**	**RATE_FIX**
Type														RW	RW	RW
Reset														0	0	0

Bit(s)	Name	Description
2	FREQ_SEL	0: System clock = UART_CLK_SRC/2 1: System clock = UART_CLK_SRC/4
1	AUTOBAUD_RATE_FIX	0: System clock = UART_CLK_SRC/1 (UART_CLK_SRC = 52MHz or 26MHz) 1: System clock = UART_CLK_SRC/2 or UART_CLK_SRC/4 (depends on FREQ_SEL)
0	RATE_FIX	0: System clock = UART_CLK_SRC/1 (UART_CLK_SRC = 52MHz or 26MHz) 1: System clock = UART_CLK_SRC/2 or UART_CLK_SRC/4 (depends on FREQ_SEL)

11003038 AUTOBAUDSAMPLE Auto Baud Sample Register 0D

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name											**AUTOBAUDSAMPLE**					
Type											RW					
Reset											0	0	1	1	0	1

Bit(s)	Name	Description
5:0	AUTOBAUDSAMPLE	**CLK division for autobaud rate detection** For standard baud rate detection. system clk 52m: 'd 27

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Name	Description
		system clk 26m: 'd 13 system clk 13m: 'd 6 For non-standard baud rate detection.

1100303C **GUARD** **Guard Time Added Register** **0F**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name												GUARD_EN	GUARD_CNT			
Type												RW	RW			
Reset												0	1	1	1	1

Bit(s)	Name	Description
4	GUARD_EN	**Guard interval add enable signal** 0: No guard interval added 1: Add guard interval after stop bit
3:0	GUARD_CNT	**Guard interval count value** Guard interval = [1/(system clock/div_step/div)]*GUARD_CNT

11003040 **ESCAPE_DAT** **Escape Character Register** **FF**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									ESCAPE_DAT							
Type									RW							
Reset									1	1	1	1	1	1	1	1

Bit(s)	Name	Description
7:0	ESCAPE_DAT	**Escape character added before software flow control data and escape character** If TX data are xon (31h) with esc_en =1, UART transmits data as esc + CEh (~xon).

11003044 **ESCAPE_EN** **Escape Enable Register** **00**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																ESC_EN
Type																RW
Reset																0

Bit(s)	Name	Description
0	ESC_EN	**Adds escape character in transmitter and removes escape character in receiver by UART** 0: Does not deal with the escape character 1: Add escape character in transmitter and remove escape character in receiver

11003048 **SLEEP_EN** **Sleep Enable Register** **00**

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																SLEEP_EN
Type																RW
Reset																0

Bit(s)	Name	Description
0	SLEEP_EN	**For sleep mode issue** 0: Does not deal with sleep mode indicate signal 1: Activate hardware flow control or software control according to software initial setting when chip enters sleep mode. Release hardware flow when chip wakes up. For software control, UART sends xon when awaken and when FIFO does not reach threshold level.

1100304C DMA_EN DMA Enable Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													FIFO_lsr_sel	TO_CNT_AUTORST	TX_DMA_EN	RX_DMA_EN
Type													RW	RW	RW	RW
Reset													0	0	0	0

Bit(s)	Name	Description
3	FIFO_lsr_sel	**Selects FIFO LSR mode** 0: LSR updates automatically with read data from RX FIFO. 1: LSR holds the first line status error state until you read the LSR register.
2	TO_CNT_AUTORST	**Time-out counter auto reset register** 0: After RX time-out happens, SW shall reset the interrupt by reading UART 0x4C. 1: The time-out counter will be auto reset. Set this register when Rain's new DMA is used.
1	TX_DMA_EN	**TX_DMA mechanism enable signal** 0: Does not use DMA in TX 1: Use DMA in TX. When this register is enabled, the flow control is based on the DMA threshold and generates a time-out interrupt for DMA.
0	RX_DMA_EN	**RX_DMA mechanism enable signal** 0: Does not use DMA in RX 1: Use DMA in RX. When this register is enabled, the flow control is based on the DMA threshold and generates a time-out interrupt.

11003050 RXTRI_AD RX Trigger Address 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													RXTRIG			
Type													RW			
Reset													0	0	0	0

Bit(s)	Name	Description
3:0	RXTRIG	**When {rtm,rtl}=2'b11, The RX FIFO threshold will be RXtrig.** The value is suggested to be less than half of RX FIFO size, which is 32 Bytes.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

11003054 FRACDIV_L Fractional Divider LSB Address 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									FRACDIV_L							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	FRACDIV_L	**Adds sampling count (+1) from State Data7 to Data 0 in order to contribute fractional divisor** Only when high_speed=3.

11003058 FRACDIV_M Fractional Divider MSB Address 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name															FRACDIV_M	
Type															RW	
Reset															0	0

Bit(s)	Name	Description
1:0	FRACDIV_M	**Adds sampling count when in state stop to parity in order to contribute fractional divisor** Only when high_speed=3.

1100305C FCR_RD FIFO Control Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									RFTL1_RFTLo		TFTL1_TFTLo			CLRT	CLRR	FIFOE
Type									RO		RO			RO	RO	RO
Reset									0	0	0	0		0	0	0

Bit(s)	Name	Description
7:6	RFTL1_RFTLo	**RX FIFO trigger threshold** RX FIFO contains total 32 bytes. 0: 1 1: 6 2: 12 3: RXTRIG
5:4	TFTL1_TFTLo	**TX FIFO trigger threshold** TX FIFO contains total 32 bytes. 0: 1 1: 4 2: 8 3: 14
2	CLRT	0: TX FIFO is not cleared. 1: TX FIFO is cleared.
1	CLRR	0: RX FIFO is not cleared. 1: RX FIFO is cleared.
0	FIFOE	**Enables FIFO** This bit must be set to 1 for any other bits in the registers to take effect.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Name	Description
		0: RX and TX FIFOs are not enabled. 1: RX and TX FIFOs are enabled.

11003090 DLL Divisor Latch (LS) 01

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									DLL							
Type									RW							
Reset									0	0	0	0	0	0	0	1

Bit(s)	Name	Description
7:0	DLL	Divisor latch low 8-bit data

11003094 DLM Divisor Latch (MS) 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									DLM							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	DLM	**Divisor latch high 8-bit data** *Note: Division by 1 generates a BAUD signal that is constantly high. DLL & DLM setting formula is {DLH,DLL}=(system clock frequency/baud_pulse/baud_rate).* When RATE_FIX(RATEFIX_AD[0])=0, system clock frequency = 52MHz. When RATE_FIX(RATEFIX_AD[0])=1 and RATE_FIX(RATEFIX_AD[2])=0, system clock frequency = 26MHz. When RATE_FIX(RATEFIX_AD[0])=1 and RATE_FIX(RATEFIX_AD[2])=1, system clock frequency = 13MHz. For baud_pulse value refer to HIGH_SPEED(offset=24H) register, e.g. when 52MHz, default speed mode and 115200 baud rate, {DLH,DLL}=52MHz/16/115200=28.

11003098 EFR Enhanced Feature Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									AUTO_CTS	AUTO_RTS		ENABLE_E	SW_FLOW_CONT			
Type									RW	RW		RW	RW			
Reset									0	0		0	0	0	0	0

Bit(s)	Name	Description
7	AUTO_CTS	**Enables hardware transmission flow control** 0: Disable 1: Enable
6	AUTO_RTS	**Enables hardware reception flow control** 0: Disable 1: Enable
4	ENABLE_E	**Enables enhancement feature** 0: Disable

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Name	Description
		1: Enable
3:0	SW_FLOW_CONT	**Software flow control bits** 00xx: No TX flow Control 10xx: Transmit XON1/XOFF1 as flow control bytes 01xx: Transmit XON2/XOFF2 as flow control bytes xx00: No RX Flow Control xx10: Receive XON1/XOFF1 as flow control bytes xx01: Receive XON2/XOFF2 as flow control bytes

1100309C **FEATURE_SEL** **UART Feature Select Register** **00**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																FEATURE_SEL
Type																RW
Reset																0

Bit(s)	Name	Description
0	FEATURE_SEL	**For AP MCU side UART, if new UART register map is used, feature_sel should be kept at 1.** 0: Disable new register map 1: Enable new register map

110030A0 **XON1** **XON1 Char Register** **00**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									XON1							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	XON1	XON1 character for software flow control

Bit(s)	Name	Description
0	SLEEP_ACK	0: UART is not in idle state. (CPU can poll this register to get the UART state.) 1: UART is in idle state. (CPU can poll this register to get the UART state.)

110030BC SPM_SEL SPM Interface Selection Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name																SPM_SEL
Type																RW
Reset																0

Bit(s)	Name	Description
0	SPM_SEL	0: SPM sleep interface will not be used. 1: SPM sleep interface will be used.

5.4.5 Programming Guide

5.4.5.1 Auto Baud Rate Detection

UART can detect the baud rate used automatically. Follow the steps below:

1. Set up register autobaud_en to start detecting the data.
2. Send data of ASCII code "AT" or "at" to UART from the connected host, e.g. the PC.
3. Check if the "AT" or "at" is received. If received, the setting is now already set for further transmission.

5.4.5.2 Transmission

Follow the steps below for UART transmission:

1. Use the autobaud function to set up the baud rate or set up the parameters by yourself. The settings needed can be found in register DLL, DLM ,HIGH SPEED.
2. After setting up the baud rate, start the transmission by filling the TX FIFO and receiving data from RX FIFO.
3. Virtual FIFO can also be used for the transmission. To use the virtual FIFO, you need APDMA settings (refer to details in the APDMA section).

5.5 USB 2.0 High Speed Dual-Role Controller

5.5.1 Introduction

The USB controller is configured for supporting 8 endpoints to receive packets and 8 endpoints to send packets except for endpoint 0. These endpoints can be individually configured in the software to handle either Bulk transfers, Interrupt transfers or Isochronous transfers. There are 8 DMA channels and the embedded RAM size is configurable size up to 8K bytes. The embedded RAM can be dynamically configured to each endpoint. As the host for point-to-point communications, the controller maintains a frame counter and automatically schedules SOF, Isochronous, Interrupt and Bulk transfers.

5.5.2 Features

The following table lists the unified USB IP features.

Feature list	Description
USB specifications	USB2.0 OTG
Enhanced feature	Generic Host QMU Generic Dev QMU
Endpoint	8 Tx 8 Rx EP0
DMA channel	8
Embedded RAM	Up to 8KB
UTMI+ interface	UTMI+ 16b
CPU slave interface	AHB asynchronous design
DMA master interface	AHB busy free asynchronous design

5.5.3 USB Controller Block Diagram

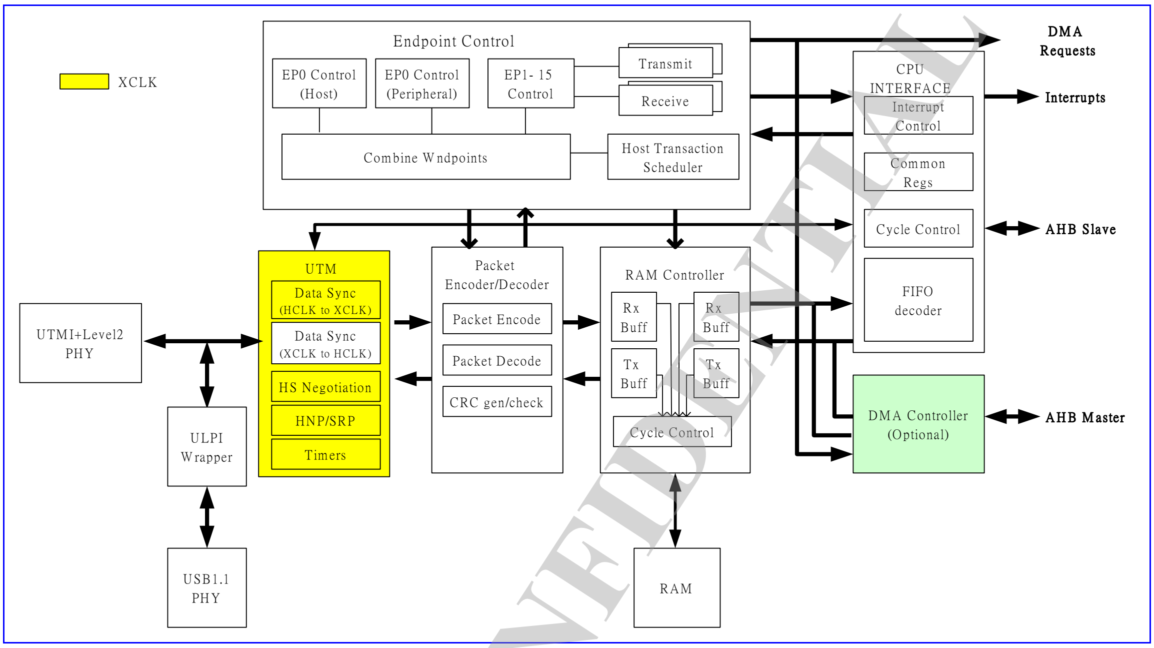

Figure 5-10. USB controller block diagram

5.5.4 Register Definition

Registers accessed using byte manipulation are marked in blue columns. Byte accessing registers can be accessed using word manipulation. Word accessing registers cannot be accessed using the byte manipulation.

Register address	Register name	Manipulation (Byte/Word)	Acronym
Common Registers			
USB + 0000h	Function address register	Byte	FADDR
USB + 0001h	Power management register	Byte	POWER
USB + 0002h	Tx interrupt status register	Byte	INTRTX
USB + 0004h	Rx interrupt status register	Byte	INTRRX
USB + 0006h	Tx interrupt enable register	Byte	INTRTXE
USB + 0008h	Rx interrupt enable register	Byte	INTRRXE
USB + 000Ah	Common USB interrupts register	Byte	INTRUSB
USB + 000Bh	Common USB interrupts enable register	Byte	INTRUSBE
USB + 000Ch	Frame number register	Byte	FRAME
USB + 000Eh	Endpoint selecting index register	Byte	INDEX
USB + 000Fh	Test mode enable register	Byte	TESTMODE
Indexed EndPoint CSR Region *n stands for endpoint number.* *For example, endpoint 1's n = 1. Valid n = 1 ~ MaxEndPoint.* *MaxEndPoint is hardware configured and the maximum is 15.*			

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Register address	Register name	Manipulation (Byte/Word)	Acronym
USB + 0010h ~ USB + 001Fh	It maps to CSR EP0 ~ EPx depending on the INDEX register. For example, if INDEX is n, address 0010h ~ 001Fh are mapped to 0x(100+10*n)h ~ 0x(100+10*n+F)h.	Byte	Indexed CSR
USB + 0020h	USB endpoint 0 FIFO register	Byte	FIFO0
USB + 0020h +(n)*4 h	USB endpoint n FIFO register	Byte	FIFOn
OTG, Dynamic FIFO, Version Registers			
USB + 0060h	OTG device control register	Byte	DEVCTL
USB + 0061h	Power up counter register	Byte	PWRUPCNT
USB + 0062h	Tx FIFO size register	Byte	TXFIFOSZ
USB + 0063h	Rx FIFO size register	Byte	RXFIFOSZ
USB + 0064h	Tx FIFO address register	Byte	TXFIFOADD
USB + 0066h	Rx FIFO address register	Byte	RXFIFOADD
USB + 006Ch	Hardware capability register	Byte	HWCAPS
USB + 006Eh	Hardware sub version register	Byte	HWSVERS
Hardware Configuration, Special Setting Registers			
USB + 0070h	USB bus performance register 1	Byte	BUSPERF1
USB + 0072h	USB bus performance register 2	Byte	BUSPERF2
USB + 0074h	USB bus performance register 3	Byte	BUSPERF3
USB + 0078h	Information about number of Tx and Rx register	Byte	EPINFO
USB + 0079h	Information about the width of RAM and the number of DMA channel register	Byte	RAMINFO
USB + 007Ah	Info. about delay to be applied register	Byte	LINKINFO
USB + 007Bh	Vbus pulsing charge register	Byte	VPLEN
USB + 007Ch	Time buffer available on HS transactions register	Byte	HS_EOF1
USB + 007Dh	Time buffer available on FS transactions register	Byte	FS_EOF1
USB + 007Eh	Time buffer available on LS transactions register	Byte	LS_EOF1
USB + 007Fh	Reset information register	Byte	RST_INFO
USB + 0080h	Rx data toggle set/status register	Word	RXTOG
USB + 0082h	Rx data toggle enable register	Word	RXTOGEN
USB + 0084h	Tx data toggle set/status register	Word	TXTOG
USB + 0086h	Tx data toggle enable register	Word	TXTOGEN
Level1 interrupt Control/Status registers			
USB + 00A0h	USB Level 1 interrupt status register	Byte	USB_L1INTS
USB + 00A4h	USB Level 1 interrupt unmask register	Byte	USB_L1INTM
USB + 00A8h	USB Level 1 interrupt polarity register	Byte	USB_L1INTP
USB + 00ACh	USB Level 1 interrupt control register	Byte	USB_L1INTC
Non-indexed EndPoint CSR Region *n stands for endpoint number.* *For example, endpoint 1's n = 1. Valid n = 1 ~ MaxEndPoint.* *MaxEndPoint is hardware configured and the maximum is 15.*			
USB + 0102h	EP0 control status register	Byte	CSR0
USB + 0108h	EP0 received bytes register	Byte	COUNT0

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Register address	Register name	Manipulation (Byte/Word)	Acronym
USB + 010Bh	NAK limit register	Byte	NAKLIMT0
USB + 010Fh	Core configuration register	Byte	CONFIGDATA
USB + 0100h +(n)*10h	TXMAP register	Byte	TXMAP(n)
USB + 0102h +(n)*10h	Tx CSR register	Byte	TXCSR(n)
USB + 0104h +(n)*10h	RXMAP register	Byte	RXMAP(n)
USB + 0106h +(n)*10h	Rx CSR register	Byte	RXCSR(n)
USB + 0108h +(n)*10h	Rx Count register	Byte	RXCOUNT(n)
USB + 010Ah +(n)*10h	TxType register	Byte	TXTYPE(n)
USB + 010Bh +(n)*10h	TxInterval register	Byte	TXINTERVAL(n)
USB + 010Ch +(n)*10h	RxType register	Byte	RXTYPE(n)
USB + 010Dh +(n)*10h	RxInterval register	Byte	RXINTERVAL(n)
USB + 010Fh +(n)*10h	Configured FIFO size register	Byte	FIFOSIZE(n)
DMA Channels Control Registers *M stands for DMA channel number.* *For example, DMA channel 1's M = 1. Valid M = 1 ~ MaxDMAChannel.* *MaxDMAChannel is hardware configured and the maximum is 8.*			
USB + 0200h	DMA interrupt status register (word access only)	Word	DMA_INTR
USB + 0210h	DMA limiter register (word access only)	Word	DMA_LIMITER
USB + 0220h	DMA configuration register (word access only)	Word	DMA_CONFIG
USB + 0204h +(M-1)*10h	DMA channel M control register (word access only)	Word	DMA_CNTL_M
USB + 0208h +(M-1)*10h	DMA channel M address register (word access only)	Word	DMA_ADDR_M
USB + 020Ch +(M-1)*10h	DMA channel M byte count register (word access only)	Word	DMA_COUNT_M
EndPoint RX Packet Count Register *n stands for endpoint number. For example, endpoint 1's n = 1. Valid n = 1 ~ MaxEndPoint.* *MaxEndPoint is hardware configured and the maximum is 15.*			
USB + 0300h +(n)*4h	EPn RxPktCount register	Word	EPnRXPKTCOUNT
Host/Hub Control Registers (Host mode only registers) *n stands for endpoint number. For example, endpoint 1's n = 1. Valid n = 1 ~ MaxEndPoint.* *MaxEndPoint is hardware configured and maximum is 15.*			
USB + 0480h +8*n h	Transmit endpoint n function address	Word	TXFUNCADDR
USB + 0482h	Transmit endpoint n hub/port address	Word	TXHUBADDR

11200000 FADDR Function Address Register (Device Mode Only) 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name										FUNCTION_ADDRESS						
Type										RW						
Reset										0	0	0	0	0	0	0

Bit(s)	Name	Description

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Name	Description
6:0	FUNCTION_ADDRESS	FAddr is an 8-bit register that should be written with the 7-bit address of the peripheral part of the transaction. When the USB2.0 controller is used in Peripheral mode (DevCtl.bit2=0), this register should be written with the address received through a SET_ADDRESS command, which will then be used for decoding the function address in subsequent token packets. When the USB2.0 controller is used In host mode (DevCtl.bit2=1), Function address is configured by TXFUNCADDR and RXFUNCADDR.

11200001 POWER_PERI Power Management Register 20

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									**ISOUPDATE**	**SOFTCONN**	**HSENAB**	**HSMODE**	**RESET**	**RESUME**	**SUSPENDMODE**	**ENABLESUSPENDM**
Type									RW	RW	RW	RU	RU	RW	RU	RW
Reset									0	0	1	0	0	0	0	0

Bit(s)	Name	Description
7	ISOUPDATE	**When set by the CPU, the USB2.0 controller will wait for an SOF token from the time TxPktRdy is set before sending the packet. If an IN token is received before an SOF token, a 0 length data packet will be sent.** Note: Only valid in Peripheral mode. Also, This bit only affects endpoints performing Isochronous transfers.
6	SOFTCONN	**If Soft Connect/Disconnect feature is enabled, the USB D+/D- lines is enabled when this bit will be set by the CPU and tri-stated when this bit is cleared by the CPU.** In Peripheral FS mode, clearing the Softcon bit may need the execution of latency until USB BUS SE0 is detected by HW. Execution Latency ~= 1ms. Such as SOF Packet EOP or RESET In Peripheral HS mode, clear Softcon bit still need execution latency until USB BUS SE0 is detected by HW. Execution Latency ~= 1us. Note: Set this bit only in Peripheral mode. For Host mode, this bit will be set if DEVCTL[0] session bit is set. This bit should also be cleared if session bit is cleared by CPU.
5	HSENAB	**When set by the CPU, the USB2.0 controller will negotiate for high-speed mode when the device is reset by the hub. If not set, the device will only operate in full-speed mode.**
4	HSMODE	**When set, This read-only bit indicates the high-speed mode is successfully negotiated during USB reset.** In Peripheral mode, it becomes valid when USB reset is completed (as indicated by USB reset interrupt). In host mode, it becomes valid when the Reset bit is cleared. Remains valid for the duration of the session. Note: Allowance is made for Tiny-J signaling in determining the transfer speed to select.
3	RESET	**Set when Reset signaling is present on the bus.** Note: This bit is read/write from the CPU in host mode but read-only in Peripheral mode.
2	RESUME	**Set by the CPU to generate Resume signaling when the function is in Suspend mode. The CPU clears this bit after 10ms (max. 15ms) to end Resume signaling. In host mode, this bit is also automatically set when Resume signaling from the target is detected while the USB2.0 controller is suspended.**

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Name	Description
1	SUSPENDMODE	**In host mode, this bit is set by the CPU to enter Suspend mode.** In Peripheral mode, this bit is set on entryo into Suspend mode. It is cleared when the CPU reads the interrupt register or sets up the Resume bit above.
0	ENABLESUSPENDM	**Set by the CPU to enable the SUSPENDM output**

11200001 **POWER_HOST** **Power Management Register** **20**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

1120000A INTRUSB Common USB Interrupt Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									VBUSERROR	SESSREQ	DISCON	CONN	SOF	RESET_BABLE	RESUME	SUSPEND
Type									W1C	W1C	W1C	W1C	W1C	W1C	W1C	W1C
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7	VBUSERROR	**Set when VBus drops below the VBus Valid threshold during a session.**

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Bit(s)	Name	Description
		Only valid when USB2.0 controller is 'A' device.
6	SESSREQ	**Set when Session Request signaling has been detected.** Only valid when USB2.0 controller is 'A' device.
5	DISCON	**Set In host mode when a device disconnect is detected. Set in Peripheral mode when a session ends.** Valid at all transaction speeds.
4	CONN	**Set when a device connection is detected.** Only valid in host mode. Valid at all transaction speeds.
3	SOF	**Set when a new frame starts.**
2	RESET_BABLE	**Set in Peripheral mode when Reset signaling is detected on the bus. Set In host mode when babble is detected.** Note: Only active after the first SOF has been sent.
1	RESUME	**Set when Resume signaling is detected on the bus while the USB2.0 controller is in Suspend mode.**
0	SUSPEND	**Set when Suspend signaling is detected on the bus.** Only valid in Peripheral mode.

1120000B INTRUSBE Common USB Interrupt Enable Register 06

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									VBUSERROR_E	SESSREQ_E	DISCON_E	CONN_E	SOF_E	RESET_BABLE_E	RESEUM_E	SUSPEND_E

1120000E INDEX Endpoint Selection Index Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													SELECTED_ENDPOINT			
Type													RW			
Reset													0	0	0	0

Bit(s)	Name	Description
3:0	SELECTED_ENDPOINT	**Each Tx endpoint and each Rx endpoint has its own set of control/status registers located between USB+100h - USB+1FFh.** In addition, one set of Tx control/status and one set of Rx control/status registers appear at USB+010h - USB+01Fh. Index is a 4-bit register that determines which endpoint control/status registers are accessed. Before accessing an endpoint's control/status registers at USB+010h - USB+01Fh, the endpoint number should be written to the Index register to ensure that the correct control/status registers appear in the memory map.

1120000F TESTMODE Test Mode Enable Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									FORCE_HOST	FIFO_ACCESS	FORCE_FS	FORCE_HS	TEST_PACKET	TEST_K	TEST_J	TEST_SE0_NAK
Type									RW	A0	RW	RW	RW	RW	RW	RW
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7	FORCE_HOST	**The CPU sets up this bit to instruct the core to enter Host mode when the Session bit is set, regardless of whether it is connected to any peripheral.** The state of the CID input, HostDisconnect and LineState signals are ignored. The core will then remain In host mode until the Session bit is cleared, even if a device is disconnected, and if the Force_Host bit remains set, will re-enter Host mode the next time the Session bit is set.While in this mode, the status of the HOSTDISCON signal from the PHY may be read from bit 7 of the ACTLR0.DevCtl register. The operating speed is determined from the Force_HS and Force_FS bits as follows. USB2.0 IP only Force_HS Force_FS Operating Speed 0 0 Low Speed 0 1 Full Speed 1 0 High Speed 1 1 Undefined
6	FIFO_ACCESS	**The CPU sets up this bit to transfer the packet in the Endpoint 0 Tx FIFO to the Endpoint 0 Rx FIFO.** It is cleared automatically. USB2.0 IP only.
5	FORCE_FS	**The CPU sets up this bit either in conjunction with bit 7 above or to force the USB2.0 controller into Full speed mode when it receives a USB reset**
4	FORCE_HS	**The CPU sets up this bit either in conjunction with bit 7 above or to force the USB2.0 controller into high-speed mode when it receives a USB reset.** USB2.0 IP only.
3	TEST_PACKET	**(HS_MODE) The CPU sets up this bit to enter the Test_Packet test mode. In this mode, the USB2.0 controller repetitively transmits on the bus a 53-byte test packet, the form of which is defined in the Universal Serial Bus Specification Revision 2.0, Section 7.1.20.** *Note: The test packet has a fixed format and must be loaded into the*

MEDIATEK CONFIDENTIAL

Bit(s)	Name	Description
		Endpoint 0 FIFO before the test mode is entered. USB2.0 IP only.
2	TEST_K	**(HS_MODE) The CPU sets up this bit to enter the Test_K test mode.** In this mode, the USB2.0 controller transmits a continuous K on the bus. USB2.0 IP only.
1	TEST_J	**(HS_MODE) The CPU sets up this bit to enter the Test_J test mode.** In this mode, the USB2.0 controller transmits a continuous J on the bus. USB2.0 IP only.
0	TEST_SE0_NAK	**(HS_MODE) The CPU sets up this bit to enter the Test_SE0_NAK test mode.** In this mode, the USB2.0 controller remains in high-speed mode but responds to any valid IN token with a NAK. USB2.0 IP only.

11200010 TXMAP TXMAP Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name				M_1		MAXIMUM_PAYLOAD_TRANSACTION										
Type				RW		RW										
Reset				0	0	0	0	0	0	0	0	0	0	0	0	0

Bit(s)	Name	Description
12:11	M_1	**Maximum payload size for indexed TX endpoint, M-1 Packet multiplier m maximum payload transaction register**
10:0	MAXIMUM_PAYLOAD_TRANSACTION	**The TxMaxP register defines the maximum amount of data that can be transferred through the selected Tx endpoint in asingle operation.** There is a TxMaxP register for each Tx endpoint (except for Endpoint 0). Bits 10:0 define (in bytes) the maximum payload transmitted in a single transaction. The value set can be up to 1024 bytes but is subject to the constraints placed by the USB Specification on packet sizes for Bulk, Interrupt and Isochronous transfers in full-speed and high-speed operations. Where the option of High-bandwidth Isochronous endpoints or of packet splitting on Bulk endpoints has been taken when the core is configured, the register includes either 2 or 5 further bits that define a multiplier m which is equal to one more than the value recorded. In the case of Bulk endpoints with the packet splitting option enabled, the multiplier m can be up to 32 and defines the maximum number of 'USB' packets (i.e. packets for transmission over the USB) of the specified payload into which a single data packet placed in the FIFO should be split, prior to transfer. (If the packet splitting option is not enabled, bit15-13 will not be implemented and bit12-11 (if included) will be ignored.) *Note: The data packet is required to be an exact multiple of the payload specified by bits 10:0, which is itself required to be either 8, 16, 32, 64 or (in the case of high-speed transfers) 512 bytes. For Isochronous endpoints operating in high-speed mode and with the high-bandwidth option enabled, m may only be either 2 or 3 (corresponding to bit 11 set or bit 12 set, respectively) and it specifies the maximum number of such transactions that can take place in a single microframe. If either bit 11 or bit 12 is non-0, the USB2.0 controller will automatically split any data packet written to the FIFO into up to 2 or 3 'USB' packets, each containing the specified payload (or less). The maximum payload for each transaction is 1024 bytes, so this allows up to 3072 bytes to be transmitted in each microframe. (For Isochronous/Interrupt transfers in Full-speed mod, bits 11 and 12 are ignored.) The value written to bits 10:0 (multiplied by m in the case of high-bandwidth Isochronous transfers) must match the value given in the wMaxPacketSize field of the Standard Endpoint Descriptor for the associated endpoint . A mismatch can cause unexpected results. The total amount of data represented by the value written to this register (specified payload * m)*

This document contains information that is proprietary to MediaTek Inc.

Bit(s)	Name	Description
		must not exceed the FIFO size for the Tx endpoint and should not exceed half the FIFO size if double-buffering is required. If this register is changed after packets have been sent from the endpoint, the Tx endpoint FIFO should be completely flushed (using the FlushFIFO bit in TxCSR) after writing the new value to this register.

11200012 TXCSR_PERI Tx CSR Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	AUTOSET	ISO		DMAREQEN	FRCDATATOG	DMAREQMODE		SETTXPKTRDY_TWICE	INCOMPTX	CLRDATATOG	SENTSTALL	SENDSTALL	FLUSHFIFO	UNDERRUN	FIFONOTEMPTY	TXPKTRDY
Type	RW	RW		RW	RW	RW		A1	A1	A0	A1	RW	A0	A1	RU	A0
Reset	0	0		0	0	0		0	0	0	0	0	0	0	0	0

Bit(s)	Name	Description
15	AUTOSET	**If The CPU sets up this bit, TxPktRdy will be automatically set when data of the maximum packet size (value in TxMaxP) is loaded into the TxFIFO.** If a packet of less than the maximum packet size is loaded, TxPktRdy will have to be set manually.
14	ISO	**The CPU sets up this bit to enable the Tx endpoint for Isochronous transfers and clears it to enable the Tx endpoint for Bulk or Interrupt transfers.** *Note: This bit only has any effect in Peripheral mode. In host mode, it always returns to 0.*
12	DMAREQEN	**The CPU sets up this bit to enable the DMA request for the Tx endpoint.**
11	FRCDATATOG	**The CPU sets up this bit to force the endpoint data toggle to switch and the data packet to be cleared from the FIFO, regardless of whether an ACK was received.** This can be used by Interrupt Tx endpoints that are used to communicate rate feedback for Isochronous endpoints.
10	DMAREQMODE	**The CPU sets up this bit to select DMA Request Mode 1 and clears it to select DMA Request Mode 0.** *Note: This bit must not be cleared either before or in the same cycle as the DMAReqEn bit is cleared.*
8	SETTXPKTRDY_TWICE	**Indicates TxPktRdy had been set when it is 1'b1 already Write 0 to clear it.**
7	INCOMPTX	**When the endpoint is used for high-bandwidth Isochronous/Interrupt transfers, this bit is set to indicate where a large packet has been split into 2 or 3 packets for transmission but insufficient IN tokens have been received to send all the parts.** *Note: In anything other than a high-bandwidth transfer, this bit will always return to 0.* Write 0 to clear it.
6	CLRDATATOG	**The CPU writes 1 to this bit to reset the endpoint data toggle to 0.**
5	SENTSTALL	**This bit is set when a STALL handshake is transmitted.** The FIFO is flushed, Tx interrupt is generated if enabled and the TxPktRdy bit is cleared. Cleared by CPU. Write 0 to clear it.
4	SENDSTALL	**The CPU writes 1 to this bit to issue a STALL handshake to an IN token.**

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Name	Description
		The CPU clears this bit to terminate the stall condition. Note: This bit has no effect where the endpoint is used for Isochronous transfer. Otherwise, CPU should wait for SENTSTALL interrupt being generated before clearing the SENDSTALL bit.
3	FLUSHFIFO	**The CPU writes 1 to this bit to flush the latest packet from the endpoint TxFIFO.** The FIFO pointer is reset, the TxPktRdy bit is cleared and an interrupt is generated. May be set simultaneously with TxPktRdy to abort the packet that is currently being loaded into the FIFO. *Note: FlushFIFO should only be used when TxPktRdy is set. In other cases, it may cause data corruption. If the FIFO is double-buffered, FlushFIFO may need to be set twice to completely clear the FIFO.*
2	UNDERRUN	**The USB sets up this bit if an IN token is received when the TxPktRdy bit not set.** Cleared by CPU. Write 0 to clear it.
1	FIFONOTEMPTY	**The USB sets up this bit when there is at least 1 packet in TxFIFO.** This bit will be asserted automatically when TXPKTRDY is set by CPU and de-asserted when CPU flushes FIFO or sends a STALL packet.
0	TXPKTRDY	**The CPU sets up this bit after loading a data packet into FIFO.** It is cleared automatically when a data packet has been transmitted. An interrupt is also generated at this point (if enabled). TxPktRdy is also automatically cleared (interrupt is generated) prior to loading a second packet into a double-buffered FIFO.

11200012 <u>TXCSR_HOST</u> Tx CSR Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

7	CLRDATATOG	**The CPU writes 1 to this bit to reset the endpoint data toggle to 0.**
6	RXSTALL	**When a STALL handshake is received, this bit will be set and an interrupt generated.** Cleared by CPU. Write 0 to clear it.
5	REQPKT	**The CPU writes 1 to this bit to request an IN transaction.** Cleared when RxPktRdy is set.
4	FLUSHFIFO	**The CPU writes 1 to this bit to flush the next packet to be read from the endpoint RxFIFO.** The RxFIFO pointer is reset and the RxPktRdy bit is cleared. *Note: FlushFIFO should only be used when RxPktRdy is set. In other cases, it may cause data corruption. If RxFIFO is double buffered, FlushFIFO may need to be set twice to completely clear RxFIFO.*
3	DATAERR_NAKTIME OUT	**In Bulk mode, this bit will be set when the Rx endpoint is halted following the receipt of NAK responses for longer than the time set as the NAK Limit by the RxInterval register.** The CPU clears this bit to allow endpoint to continue. Write 0 to clear it. When operating in ISO mode, this bit is set when RxPktRdy is set if the data

MEDIATEK CONFIDENTIAL

Bit(s)	Name	Description
		packet has a CRC or bit-stuff error and cleared when RxPktRdy is cleared.
2	ERROR	**The USB sets up this bit when 3 attempts have been made to receive a packet and no data packet has been received.** Cleared by CPU. An interrupt will be generated when the bit is set. *Note: This bit is only valid when the Rx endpoint is operating in Bulk or Interrupt mode. Write 0 to clear it.* In ISO mode, it always returns to 0.
1	FIFOFULL	**Set when no more packets can be loaded into RxFIFO.**
0	RXPKTRDY	**Set when a data packet has been received (to RxFIFO).** The CPU clears this bit when the packet has been unloaded from the RxFIFO. An interrupt will be generated when the bit is set. Write 0 to clear it.

11200018 RXCOUNT Rx Count Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name			RXCOUNT													
Type			RU													
Reset			0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit(s)	Name	Description
13:0	RXCOUNT	**A 14-bit read-only register that holds the number of received data bytes in the packet in RxFIFO** *Note: The value returned changes as the FIFO is unloaded and is Only valid when RxPktRdy (RxCSR.D0) is set.*

1120001A TXTYPE TxType Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									TX_SPEED		TX_PROTOCOL		TX_TARGET_EP_NUMBER

1120001B TXINTERVAL TxInterval Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									TX_POLLING_INTERVAL_NAK_LIMIT_M							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	TX_POLLING_INTERVAL_NAK_LIMIT_M	**(Host mode only) TxInterval Register TxInterval is an 8-bit register that, for Interrupt and Isochronous transfers, defines the polling interval for the currently-selected Tx endpoint.** For Bulk endpoints, this register sets the number of frames/microframes after which the endpoint should timeout on receiving a stream of NAK responses. There is a TxInterval register for each configured Tx endpoint (except for Endpoint 0). In each case the value that is set defines a number of frames/microframes (High Speed transfers), as follows: Transfer Type | Speed | Valid values (m) | Interpretation Interrupt | Low Speed or Full Speed | 1-255 | Polling interval is m frames. Interrupt | High Speed | 1-16 | Polling interval is 2^(m-1) microframes Isochronous | Full Speed or High Speed | 1-16 | Polling interval is 2^(m-1) frames/microframes Bulk | Full Speed or High Speed | 2-16 | NAK Limit is 2^(m-1) frames/microframes. *Note: Value 0 or 1 disables the NAK timeout function.*

1120001C RXTYPE RxType Register 00

Bit(s)	Name	Description
		endpoint. Reading from these addresses unloads data from the RxFIFO for the corresponding endpoint. *Note:* *1. Transfers to and from FIFOs may be 8-bit, 16-bit or 32-bit as required, and any combination of access is allowed provided the data accessed is contiguous. However, all the transfers associated with one packet must be of the ame width so that the data is consistently byte-, word- or double-word-aligned. The last transfer may however contain fewer bytes than the previous transfers in order to complete an odd-byte or odd-word transfer. For DC/DTV projects, refer to the RISC_SIZE register to complete FIFO access.* *2. Depending on the size of the FIFO and the expected maximum packet size, the FIFOs support either single-packet or double-packet buffering. However, burst writing of multiple packets is not supported as flags need to be set after each packet is written.* *3. Following a STALL response or a Tx Strike Out error on Endpoint, the associated FIFO is completely flushed.* *(vi) Programmers don't use debug tools to monitor or read the FIFO region. The FIFO pointer will increase and cause unexpected error in MAC state machine.*

MEDIATEK CONFIDENTIAL

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									B_DEVICE	FSDEV	LSDEV	VBUS		HOSTMODE	HOSTREQ	SESSION
Type									RU	RU	RU	RU		RU	Other	Other
Reset									1	0	0	0	0	0	0	0

Bit(s)	Name	Description
7	B_DEVICE	**This read-only bit indicates whether the USB2.0 controller is operating as the 'A' device or the 'B' device.** Only valid when a session is in progress. *Note: If the core is in Force_Host mode, this bit will indicate the state of the HOSTDISCON input signal from the PHY.* 1'b0: 'A' device 1'b1: 'B' device
6	FSDEV	**This read-only bit is set when a full-speed or high-speed device has been detected being connected to the port. (High-speed devices are distinguished from full-speed by checking for high-speed chirps when the device is reset.)** Only valid in host mode.
5	LSDEV	**This read-only bit is set when a low-speed device has been detected being connected to the port. Only valid in host mode.**
4:3	VBUS	**These read-only bits encode the current VBUS level; only available with OTG function enquipped; else the register value will be undefined.** 2'b00: Below SessionEnd 2'b01: Above SessionEnd, below AValid 2'b10: Above AValid, below VBusValid 2'b11: About VBusValid
2	HOSTMODE	**This read-only bit is set when the USB2.0 controller is acting as a host.**
1	HOSTREQ	**When set, the USB2.0 controller will initiate the Host Negotiation when Suspend mode is entered.** Cleared when Host Negotiation is completed ('B' device only).
0	SESSION	**When operating as an 'A' device, this bit is set or cleared by the CPU to start or end a session.** When operating as a 'B' device, this bit is set/cleared by the USB2.0 controller when a session starts/ends. It is also set by the CPU to initiate the Session Request Protocol. When the USB2.0 controller is in Suspend mode, the bit may be cleared by the CPU to perform a software disconnect. *Note: Clearing this bit when the core is not suspended will result in undefined behavior.*

11200061 PWRUPCNT Power Up Counter Register 0F

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name													PWRUPCNT			
Type													RW			
Reset													1	1	1	1

Bit(s)	Name	Description
3:0	PWRUPCNT	**Power-up counter limit.** The power-up counter is used to count the K state duration during suspend and when it is timed out, the resume interrupt will be issued. The register should be configured according to AHB clock speed.

Name								FLUSHFIFO	SERVICESETUPEDN	SERVICEDRXPKTRDY	SENDSTALL	SETUPEND	DATAEND	SENTSTALL	TXPKTRDY	RXPKTRDY
Type								A0	A0	A0	A0	RU	A0	RW	A0	RU
Reset								0	0	0	0	0	0	0	0	0

Bit(s)	Name	Description
8	FLUSHFIFO	**The CPU writes 1 to this bit to flush the next packet to be transmitted/read from the Endpoint 0 FIFO. It is cleared automatically.** The FIFO pointer is reset and the TxPktRdy/RxPktRdy bit (below) is cleared. May be set simultaneously with TxPktRdy to abort the packet that is currently being loaded into the FIFO. *Note: FlushFIFO should only be used when TxPktRdy/RxPktRdy is set. In other cases, it may cause data corruption.*
7	SERVICESETUPEDN	**The CPU writes 1 to this bit to clear the SetupEnd bit.** It is cleared automatically.
6	SERVICEDRXPKTRDY	**The CPU writes 1 to this bit to clear the RxPktRdy bit.** It is cleared automatically.
5	SENDSTALL	**The CPU writes 1 to this bit to terminate the current transaction.** The STALL handshake will be transmitted and then this bit will be cleared automatically. *Note: The FIFO should be flushed before SendStall is set.*
4	SETUPEND	**This bit will be set when a control transaction ends before the DataEnd bit has been set.** An interrupt will be generated and the FIFO flushed at this time. The bit is cleared by the CPU writing 1 to the ServicedSetupEnd bit.
3	DATAEND	**The CPU sets up this bit: When setting TxPktRdy for the last data packet.** When clearing RxPktRdy after unloading the last data packet. When setting TxPktRdy for a 0 length data packet. It is cleared automatically.
2	SENTSTALL	**This bit is set when a STALL handshake is transmitted. Cleared by CPU.** Write 0 to clear it.
1	TXPKTRDY	**The CPU sets up this bit after loading a data packet into FIFO.** It is cleared automatically when a data packet has been transmitted. An interrupt is also generated at this point (if enabled).
0	RXPKTRDY	**This bit is set when a data packet has been received.** An interrupt is generated when this bit is set. The CPU clears this bit by setting up the ServicedRxPktRdy bit.

11200102 **CSR0_HOST** **EP0 Control Status Register** **0000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name					DISPING			FLUSHFIFO	NAKTIMEOUT	STATUSPKT	REQPKT	ERROR	SETUPPKT	RXSTALL	TXPKTRDY	RXPKTRDY
Type					RW			A0	A1	RW	RW	A1	A1	A1	A0	A1
Reset					0			0	0	0	0	0	0	0	0	0

Bit(s)	Name	Description
11	DISPING	**The CPU writes 1 to this bit to disable transmitting PING token.** This bit can be set together with TXPKTRDY. To clear DISPING function, SW can write 0 after each control transfer is done.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Name	Description
		The DisPing function will be cleared when the next SETUP transaction is finished or OUT transaction receive handshake token with NAK/NYET/Timeout. Read "1" only in USB11 configuration. Token PING is not supported in FS mode. USB2.0 IP for TX only.
8	FLUSHFIFO	**The CPU writes 1 to this bit to flush the next packet to be transmitted/read from the Endpoint 0 FIFO.** It is cleared automatically. The FIFO pointer is reset and the TxPktRdy/RxPktRdy bit (below) is cleared. May be set simultaneously with TxPktRdy to abort the packet that is currently being loaded into the FIFO. *Note: FlushFIFO should only be used when TxPktRdy/RxPktRdy is set. In other cases, it may cause data corruption.*
7	NAKTIMEOUT	**This bit will be set when Endpoint 0 is halted following the receipt of NAK responses for longer than the time set by the NAKLimit0 register.** The CPU clears this bit to allow the endpoint to continue. Write 0 to clear it.
6	STATUSPKT	**The CPU sets up this bit at the same time as the TxPktRdy or ReqPkt bit is set, to perform a status stage transaction.** Setting this bit ensures that the data toggle is set to 1 so that a DATA1 packet is used for the Status Stage transaction.
5	REQPKT	**The CPU writes 1 to this bit to request an IN transaction.** Cleared when RxPktRdy is set.
4	ERROR	**This bit will be set when three attempts have been made to perform a transaction with no response from the peripheral.** Cleared by CPU. An interrupt is generated when this bit is set. Write 0 to clear it.
3	SETUPPKT	**The CPU sets up this bit, at the same time as the TxPktRdy bit is set, to send a SETUP token instead of an OUT token for the transaction.** This bit will be automatically clear by HW when setup packet is transmitted. *Note: Setting this bit also clears the DataToggle.*
2	RXSTALL	**This bit is set when a STALL handshake is received.** Cleared by CPU. Write 0 to clear it.
1	TXPKTRDY	**The CPU sets up this bit after loading a data packet into FIFO.** It is cleared automatically when a data packet has been transmitted. An interrupt is also generated at this point (if enabled).
0	RXPKTRDY	**This bit is set when a data packet has been received.** An interrupt is generated when this bit is set. The CPU clears this bit by setting up the ServicedRxPktRdy bit. Write 0 to clear it.

11200108 COUNT0 EP0 Received Bytes Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name										EP0_RX_COUNT						
Type										RU						
Reset										0	0	0	0	0	0	0

Bit(s)	Name	Description
6:0	EP0_RX_COUNT	**Count0 is a 7-bit read-only register that indicates the number of received data bytes in the Endpoint 0 FIFO.** The value returned changes as the contents of the FIFO change and is Only valid when RxPktRdy (IDXEPR0.CSR0.bit0) is set.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

1120010A Type0 EP0 Type Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									EP0_Type							
Type									RW							
Reset									0	0						

Bit(s)	Name	Description
7:6	EP0_Type	**Operating speed of target device when core is configured with multipoint option.** When the core is not configured with the multipoint option, these bits should not be accessed. 2'b00: Unused 2'b01: High 2'b10: Full 2'b11: Low

1120010B NAKLIMT0 NAK Limit Register 00

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name												NAKLIMIT0				
Type												RW				
Reset												0	0	0	0	0

Bit(s)	Name	Description
4:0	NAKLIMIT0	**(Host mode only) NAKLimit0 is a 5-bit register that sets the number of frames/microframes (High-Speed transfers) after which Endpoint 0 should timeout on receiving a stream of NAK responses.** (Equivalent settings for other endpoints can be made through their TxInterval and RxInterval registers.). The number of frames/microframes selected is 2(m-1) (where m is the value set in the register, valid values 2 - 16). If the host receives NAK responses from the target for more frames than the number represented by the Limit set in this register, the endpoint will be halted. *Note: Value 0 or 1 disables the NAK timeout function.*

1120010C SRAMCONFIGSIZE SRAM Size Register 0800

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	SRAM_SIZE															
Type	RO															
Reset	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0

Bit(s)	Name	Description
15:0	SRAM_SIZE	**Depth of SRAM with data bus width 32 bits** For example, if the SRAM is configured to 8KB, SRAM_SIZE will be 16'h800.

1120010E HBCONFIGDA High Bind-width Configuration Register 88

Bit(s)	Name	Description
7	MPRXE	**When set to 1, automatic amalgamation of bulk packets will be selected.**
6	MPTXE	**When set to 1, automatic splitting of bulk packets will be selected.**
5	BIGENDIAN	**Set to 1 indicates Big Endian order will be selected.**
4	HBRXE	**Set to 1 indicates High-bandwidth Rx ISO Endpoint Support is selected.**
3	HBTXE	**Set to 1 indicates High-bandwidth Tx ISO Endpoint Support is selected.**
2	DYNFIFOSIZING	**Set to 1 indicates Dynamic FIFO sizing option is selected.**
1	SOFTCONE	**Set to 1 indicates Soft Connect/Disconnect option is selected.**
0	UTMIDATAWIDTH	**Indicates selected UTMI+ data width** 1'b0: 8 bits 1'b1: 16 bits

11200110 TX1MAP TX1MAP Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name				M1		MAXIMUM_PAYLOAD_TRANSACTION										
Type				RW		RW										
Reset				0	0	0	0	0	0	0	0	0	0	0	0	0

Bit(s)	Name	Description
12:11	M1	**Maximum payload size for indexed TX endpoint, M1 Packet multiplier m maximum payload transaction register**
10:0	MAXIMUM_PAYLOAD_TRANSACTION	**The TxMaxP register defines the maximum amount of data that can be transferred through the selected Tx endpoint in asingle operation.** There is a TxMaxP register for each Tx endpoint (except for Endpoint 0).Bits 10:0 define (in bytes) the maximum payload transmitted in a single transaction. The value set can be up to 1024 bytes but is subject to the constraints placed by the USB Specification on packet sizes for Bulk, Interrupt

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Name	Description
		and Isochronous transfers in full-speed and high-speed operations. Where the option of High-bandwidth Isochronous endpoints or of packet splitting on Bulk endpoints has been taken when the core is configured, the register includes either 2 or 5 further bits that define a multiplier m which is equal to one more than the value recorded. In the case of Bulk endpoints with the packet splitting option enabled, the multiplier m can be up to 32 and defines the maximum number of 'USB' packets (i.e. packets for transmission over the USB) of the specified payload into which a single data packet placed in the FIFO should be split, prior to transfer. (If the packet splitting option is not enabled, bit15-13 will not be implemented and bit12-11 (if included) will be ignored.) *Note: The data packet is required to be an exact multiple of the payload specified by bits 10:0, which is itself required to be either 8, 16, 32, 64 or (in the case of high-speed transfers) 512 bytes. For Isochronous endpoints operating in high-speed mode and with the high-bandwidth option enabled, m may only be either 2 or 3 (corresponding to bit 11 set or bit 12 set, respectively) and it specifies the maximum number of such transactions that can take place in a single microframe. If either bit 11 or bit 12 is non-0, the USB2.0 controller will automatically split any data packet written to the FIFO into up to 2 or 3 'USB' packets, each containing the specified payload (or less). The maximum payload for each transaction is 1024 bytes, so this allows up to 3072 bytes to be transmitted in each microframe. (For Isochronous/Interrupt transfers in Full-speed mod, bits 11 and 12 are ignored.) The value written to bits 10:0 (multiplied by m in the case of high-bandwidth Isochronous transfers) must match the value given in the wMaxPacketSize field of the Standard Endpoint Descriptor for the associated endpoint . A mismatch can cause unexpected results. The total amount of data represented by the value written to this register (specified payload * m) must not exceed the FIFO size for the Tx endpoint and should not exceed half the FIFO size if double-buffering is required. If this register is changed after packets have been sent from the endpoint, the Tx endpoint FIFO should be completely flushed (using the FlushFIFO bit in TxCSR) after writing the new value to this register.*

11200112 TX1CSR_PERI Tx1 CSR Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	AUTOSET	ISO		DMAREQEN	FRCDATATOG	DMAREQMODE		SETTXPKTRDY_TWICE	INCOMPTX	CLRDATATOG	SENTSTALL	SENDSTALL	FLUSHFIFO	UNDERRUN	FIFONOTEMPTY	TXPKTRDY
Type	RW	RW		RW	RW	RW		A1	A1	A0	A1	RW	A0	A1	RU	A0
Reset	0	0		0	0	0		0	0	0	0	0	0	0	0	0

Bit(s)	Name	Description
15	AUTOSET	**If The CPU sets up this bit, TxPktRdy will be automatically set when data of the maximum packet size (value in TxMaxP) is loaded into the TxFIFO.** If a packet of less than the maximum packet size is loaded, TxPktRdy will have to be set manually.
14	ISO	**The CPU sets up this bit to enable the Tx endpoint for Isochronous transfers and clears it to enable the Tx endpoint for Bulk or Interrupt transfers.** *Note: This bit only has any effect in Peripheral mode. In host mode, it always returns to 0.*
12	DMAREQEN	**The CPU sets up this bit to enable the DMA request for the Tx endpoint.**

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Bit(s)	Name	Description
11	FRCDATATOG	**The CPU sets up this bit to force the endpoint data toggle to switch and the data packet to be cleared from the FIFO, regardless of whether an ACK was received.** This can be used by Interrupt Tx endpoints that are used to communicate rate feedback for Isochronous endpoints.
10	DMAREQMODE	**The CPU sets up this bit to select DMA Request Mode 1 and clears it to select DMA Request Mode 0.** *Note: This bit must not be cleared either before or in the same cycle as the DMAReqEn bit is cleared.*
8	SETTXPKTRDY_TWICE	**Indicates TxPktRdy had been set when it is 1'b1 already** Write 0 to clear it.
7	INCOMPTX	**When the endpoint is used for high-bandwidth Isochronous/Interrupt transfers, this bit is set to indicate where a large packet has been split into 2 or 3 packets for transmission but insufficient IN tokens have been received to send all the parts.** *Note: In anything other than a high-bandwidth transfer, this bit will always return to 0.* Write 0 to clear it.
6	CLRDATATOG	**The CPU writes 1 to this bit to reset the endpoint data toggle to 0.**
5	SENTSTALL	**This bit is set when a STALL handshake is transmitted.** The FIFO is flushed, Tx interrupt is generated if enabled and the TxPktRdy bit is cleared. Cleared by CPU. Write 0 to clear it.
4	SENDSTALL	**The CPU writes 1 to this bit to issue a STALL handshake to an IN token. The CPU clears this bit to terminate the stall condition.** *Note: This bit has no effect where the endpoint is used for Isochronous transfer. Otherwise, CPU should wait for SENTSTALL interrupt being generated before clearing the SENDSTALL bit.*
3	FLUSHFIFO	**The CPU writes 1 to this bit to flush the latest packet from the endpoint TxFIFO.** The FIFO pointer is reset, the TxPktRdy bit is cleared and an interrupt is generated. May be set simultaneously with TxPktRdy to abort the packet that is currently being loaded into the FIFO. *Note: FlushFIFO should only be used when TxPktRdy is set. In other cases, it may cause data corruption. If the FIFO is double-buffered, FlushFIFO may need to be set twice to completely clear the FIFO.*
2	UNDERRUN	**The USB sets up this bit if an IN token is received when the TxPktRdy bit not set.** Cleared by CPU (write 0 to clear it).
1	FIFONOTEMPTY	**The USB sets up this bit when there is at least 1 packet in TxFIFO.** This bit will be asserted automatically when TXPKTRDY is set by CPU and de-asserted when CPU flushes FIFO or sends a STALL packet.
0	TXPKTRDY	**The CPU sets up this bit after loading a data packet into FIFO.** It is cleared automatically when a data packet has been transmitted. An interrupt is also generated at this point (if enabled). TxPktRdy is also automatically cleared (interrupt is generated) prior to loading a second packet into a double-buffered FIFO.

Bit(s)	Name	Description
		into a double-buffered FIFO.

11200114 RX1MAP RX1MAP Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name				M1		MAXIMUM_PAYLOAD_TRANSACTION										
Type				RW		RW										
Reset				0	0	0	0	0	0	0	0	0	0	0	0	0

Bit(s)	Name	Description
12:11	M1	**Maximum payload size for indexed RX endpoint, M1 Packet multiplier m**
10:0	MAXIMUM_PAYLOAD_TRANSACTION	**The RxMaxP register defines the maximum amount of data that can be transferred through the selected Rx endpoint in a single operation.** There is a RxMaxP register for each Rx endpoint (except for Endpoint 0). Bits 10:0 define (in bytes) the maximum payload transmitted in a single transaction. The value set can be up to 1024 bytes but is subject to the constraints placed by the USB Specification on packet sizes for Bulk, Interrupt and Isochronous transfers in Full-speed and High-speed operations. Where the option of High-bandwidth Isochronous endpoints or of combining Bulk packets has been taken when the core is configured, the register includes either 2 or 5 further bits that define a multiplier m which is equal to one more than the value recorded. For Bulk endpoints with the packet combining option enabled, the multiplier m can be up to 32 and defines the number of USB packets of the specified payload which are to be combined into a single data packet within the FIFO. (If the packet splitting option is not enabled, bit15-bit13 is not implemented and bit12-bit11 (if included) is ignored.) For Isochronous endpoints operating in high-speed mode and with the high-bandwidth option enabled, m may only be either 2 or 3 (corresponding to bit 11 set or bit 12 set, respectively) and it specifies the maximum number of such transactions that can take place in a single microframe. If either bit 11 or bit 12 is non-0, the USB2.0 controller will automatically combine the separate USB packets received in any microframe into a single packet within the Rx FIFO. The maximum payload for each transaction is 1024 bytes, so this allows up to 3072 bytes to be received in each microframe. (For Isochronous/Interrupt transfers in full-speed mode or if High-bandwidth is not enabled, bits 11 and 12 are ignored.) The value written to bits 10:0 (multiplied by m in the case of high-bandwidth Isochronous transfers) must match the value given in the wMaxPacketSize field of the Standard Endpoint Descriptor for the associated endpoint . A mismatch can cause unexpected results. The total amount of data represented by the value written to this register (specified payload * m) must not exceed the FIFO size for the OUT endpoint and should not exceed half the FIFO size if double-buffering is required.

11200116 RX1CSR_PERI RX1 CSR Register 0000

Bit(s)	Name	Description
15	AUTOCLEAR	**If CPU sets up this bit then the RxPktRdy bit will be automatically cleared when a packet of RxMaxP bytes has been unloaded from the RxFIFO.** When packets of less than the maximum packet size are unloaded, RxPktRdy will have to be cleared manually. *Note: The maximum packet size -3, -2, -1 is handled like the maximum packet size which is auto cleared by HW.*
14	ISO	**The CPU sets up this bit to enable the Rx endpoint for Isochronous transfers and clears it to enable the Rx endpoint for Bulk/Interrupt transfers.**
13	DMAREQEN	**The CPU sets up this bit to enable the DMA request for the Rx endpoint.**
12	DISNYET_PIDERR	**The CPU sets up this bit to disable the sending of NYET handshakes.** When set, all successfully received Rx packets are ACK'd including at the point at which the RxFIFO becomes full. Note: This bit only takes effect in high-speed mode in which it should be set for all interrupt endpoints. This bit is set when there is a PID error in the received packet. It is cleared when RxPktRdy is cleared or write 0 to clear it.
11	DMAREQMODE	**The CPU sets up this bit to select DMA Request Mode 1 and clears it to select DMA Request Mode 0.** DMA Request Mode 1: Rx endpoint interrupt is generated only when DMA Request Mode 1 and received a short packet. RxDMAReq is generated when receiving a Max-Packet-size packet.DMA Request Mode 0: No Rx endpoint interrupt. RxDMAReq is generated when RxPktRdy is set.
9	KEEPERRSTATUS	**Used when endpoint works with USBQ and in Isochronous mode** When this bit is set, the isochronous error, PIDERROR, INCOMPRX and DATAERROR will be kept and only cleared by SW.
8	INCOMPRX	**This bit will be set in an isochronous transfer if the packet in RxFIFO is incomplete because part of the data are not received.** When KeepErrorStatus = 0, it is cleared when RxPktRdy is cleared or write 0 to clear it. *Note: In anything other than an isochronous transfer, this bit will always return to 0.* Write 0 to clear it.
7	CLRDTATOG	**The CPU writes 1 to this bit to reset the endpoint data toggle to 0.**
6	SENTSTALL	**This bit is set when a STALL handshake is transmitted.** Cleared by CPU. An interrupt will be generated when the bit is set. Write 0 to clear it.
5	SENDSTALL	**The CPU writes 1 to this bit to issue a STALL handshake.** The CPU clears this bit to terminate the stall condition. *Note: This bit has no effect where the endpoint is used for ISO transfers.*
4	FLUSHFIFO	**The CPU writes 1 to this bit to flush the next packet to be read from the endpoint RxFIFO.** The RxFIFO pointer is reset and the RxPktRdy bit is cleared. *Note: FlushFIFO should only be used when RxPktRdy is set. In other cases, it may cause data corruption. If RxFIFO is double buffered, FlushFIFO may need to be set twice to completely clear RxFIFO.*
3	DATAERR	**This bit is set when RxPktRdy is set if the data packet has a CRC or bit-stuff error.** It is cleared when RxPktRdy is cleared. *Note: This bit is only valid when the endpoint is operating in ISO mode. In Bulk mode, it always returns to 0.*
2	OVERRUN	**This bit is set if an OUT packet cannot be loaded into the RxFIFO.** Cleared by CPU (write 0 to clear it).

MEDIATEK CONFIDENTIAL

Name	DMA_INTR_UNMASK_SET								DMA_INTR_UNMASK_CLEAR							
Type	A0								A0							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	DMA_INTR_UNMASK								DMA_INTR_STATUS							
Type	RU								W1C							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit(s)	Name	Description
31:24	DMA_INTR_UNMASK_SET	**Sets DMA_INTR_UNMASK to 1**
23:16	DMA_INTR_UNMASK_CLEAR	**Clears DMA_INTR_UNMASK to 0**
15:8	DMA_INTR_UNMASK	**Unmasks DMA interrupts** The DMA interrupt will be generated when DMA_INTR_UNMASK and DMA_INTR_STATUS are both 1.
7:0	DMA_INTR_STATUS	**Indicates DMA complete interrupt status, one bit per DMA channel implemented** Bit 0 is used for DMA channel 1; bit 1 is used for DMA channel 2, and so on. Write 1 to clear it. *Note: DMA interrupt will be asserted after DMA enable is disabled when a null packet is received even thought DMA_COUNT_M still does not achieve 0.*

11200204 DMA_CNTL_0 DMA Channel 0 Control Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name			DMAABORT		DMACHEN	BURST_MODE		BUSERR	ENDPNT				INTEN	DMAMODE	DMADIR	DMAEN
Type			A0		RU	RW		RU	RW				RW	RW	RW	Other
Reset			0		0	0	0	0	0	0	0	0	0	0	0	0

Bit(s)	Name	Description
13	DMAABORT	**If SW needs to abort the current DMA transfer, set DMAABORT=1 & DMAEN=0. After the transfer is aborted completely, DMA interrupt will occur.**
11	DMACHEN	**DMA channel enable monitor bit**
10:9	BURST_MODE	2'b00: Burst Mode 0: Bursts of unspecified length. 2'b01: Burst Mode 1: INCR4 or unspecified length. 2'b10: Burst Mode 2: INCR8, INCR4 or unspecified length. 2'b11: Burst Mode 3: INCR16, INCR8, INCR4 or unspecified length
8	BUSERR	**Bus error**
7:4	ENDPNT	**Endpoint which DMA will transfer with**

MEDIATEK CONFIDENTIAL

Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Name	Description
3	INTEN	**Enables interrupt**
2	DMAMODE	**DMA mode** DMA mode 0: Single packet operation DMA mode 1: Multi packets operation, with the configuration of DMAReqMode in RXCSR bit 11 DMA mode 1 can support both known size or unknown size transaction.
1	DMADIR	**Direction** 0: DMA write (Rx endpoint) 1: DMA read (Tx endpoint)
0	DMAEN	**Enables DMA** The bit will be cleared when the DMA transfer is completed. Programmers should not disable the DMA_en before the transfer is completed. If programmers disable the dma_en when transferring, the DMA will not stop immediately until the last bus transfer is completed.

11200208 DMA_ADDR_0 DMA Channel 0 Address Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name									DMA_LIMITER							
Type									RW							
Reset									0	0	0	0	0	0	0	0

Bit(s)	Name	Description
7:0	DMA_LIMITER	**Suppresses bus utilization of DMA channel** The value is from 0 to 255. 0 means no limitation, and 255 means totally banned. The value between 0 and 255 means certain DMA can have permission to use AHB every (4 x n) AHB clock cycles. *Note: It is not recommended to limit the bus utilization of the DMA channels because this increases the latency of response to the masters, and the transfer rate decreases as well. Before using it, make sure that the bus masters have a protection mechanism to avoid entering wrong states.*

11200220 DMA_CONFIG DMA Configuration Register 00000004

Type					RW		RW			RW					RW	RW
Reset					0	0	0	0		0	0	0			0	0

Bit(s)	Name	Description
11:10	DMA_ACTIVE_EN	**The two bits control usb_active.** 2'b00: usb_active depends on all DMAEN of DMA channel control registers. 2'b01: usb_active ties to 1 2'b10: usb_active ties to 0 2'b11: usb_active depends on ep_active, dma_active and all DMAEN of DMA channel control register(OR logic)
9:8	AHB_HPROT_2_EN	**The two bits control the AHB master interface HPROT2 function operateing in non-bufferable/bufferable/last transfer non-bufferable mode.** 2'b00: All the write transfers of a burst will be accessed by bufferable mode except for the last transfer of a burst. 2'b01: AHB master HPROT2 is always accessed by non-bufferable mode. 2'b10: AHB master HPROT2 is always accessed by bufferable mode. 2'b11: reserved
6:4	DMAQ_CHAN_SEL	**Selects DMA channel used by USB_DMAQ if it is available.** It will not affect if USB_DMAQ is not available.
1	AHBWAIT_SEL	**Selects AHBWAIT behavior** Set to 1 to return to old DMA master AHB wait condition. This bit is used to test DMA FIFO overflow bug.
0	BOUNDARY_1K_CRO	**Enables 1k boundary page crossing**

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Name	Description
	SS_EN	Set to 1 to force burst transfer regardless 1k boundary crossing. *Note: It will violate AHB 1k boundary specification but gain some bus performance.*

11200304 EP1RXPKTCOUNT EP1 RxPktCount Register 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	EP1RXPKTCOUNT															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit(s)	Name	Description
15:0	EP1RXPKTCOUNT	**Sets up the number of packets of Rx Endpoint n size MaxP that are to be transferred in a block transfer** Only used In host mode when AutoReq is set. Has no effect in Peripheral mode or when AutoReq is not set. RqPktCount (Host mode only) For each Rx Endpoint 1 - 15, the USB2.0 controller provides a 16-bit RqPktCount register. This read/write register is used In host mode to specify the number of packets that are to be transferred in a block transfer of one or more Bulk packets of length MaxP to Rx Endpoint n. The core uses the value recorded in this register to etermine the number of requests to issue where the AutoReq option (included in the RxCSR register) has been set. *Note: Multiple packets combined into a single bulk packet within the FIFO count as one packet.*

11200480 TOFUNCADDR To Function Address Register 0000

Name	SRAMA															
Type	RW															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit(s)	Name	Description
17	EP0_StartAd_TM6_en	**Software can enable this bit to change the EP0 FIFO start address for test mode 6 FIFO loopback test by DMA/PIO.**
16	SRAMDBG	**SRAM_DEBUG_MODE** Software can read the data in SRAM of USB core when this bit is enabled. The related registers are SRAMA, SRAMD. After setting this bit to 1, SW can set up SRAMA (SRAM address) and read the data in register SRAMD (SRAM data). Only for debugging mode and should be disabled in normal operation. 1'b0: Software sets up this bit 0 to disable SRAM_DEBUG_MODE. 1'b1: Software sets up this bit 1 to enable SRAM_DEBUG_MODE.
15:0	SRAMA	**SRAM_ADDRESS** The register is used for RISC to read data from USB SRAM. The unit is 4-byte. For example, to check 0x400 byte address, set this register to 0x100. This register is only available when the register bit SRAM_DEBUG_MODE of the register SRAMDBG is set to 1. When SRAM ADDRESS is set, SRAM DATA will display the data in the address SRAM ADDRESS in SRAM. Only for debugging mode.

5.6 USBPHY Register File

The full features include USB2.0 PHYD and PHYA macro control registers. It also includes a frequency meter for USB2.0 PHYA monitor clock. The registers can be accessed by I2C interface (FT). The default mode is accessing registers by AHB. After 0xfe (I2C access only) is configured to 8'h01, the register file will be in the I2C mode (accessing registers by I2C).

5.6.1 Feature List

- USB2.0
  - USB2.0 PHYD control registers for PHYD macro setting
  - USB2.0 PHYA control registers for PHYA characteristic tuning
  - Force USB2.0 UTMI interface for FT tests
  - Force USB2.0 PHY analog power-down in ATPG mode
  - Frequency meter for USB2.0 PHYA monitor clock
- Accessing PHY registers by AHB slave interface
- Accessing PHY registers by I2C interface

5.6.2 USBPHY Register File Block Diagram

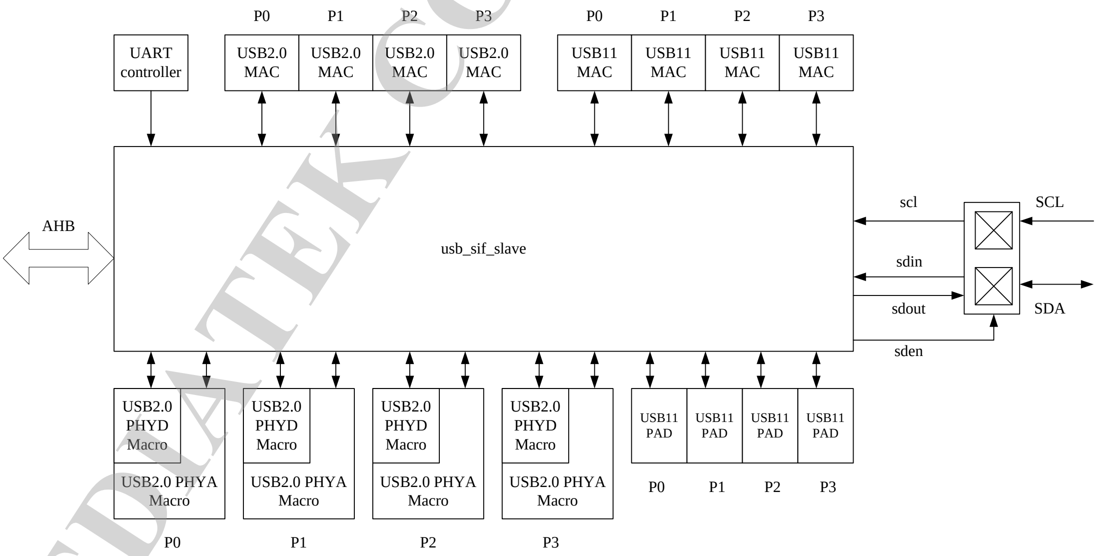

Figure 5-11. USBPHY RegFile block diagram

5.6.3 Register Definition

- Page base
  - Every page register contains 0x00h ~ 0xefh (USB2.0+ USB1.1)
  - Frequency meter registers in one page (@ 0xff = 8'h0f)
  - 0xf0~0xff: Global register
  - 0xfe[0]: I2C mode, the default value is 0 (accessing register by AHB interface)
    - If switched to I2C mode, configuring 0xfe[0] to be 1'h1 is required.
    - I2C access only
  - 0xffh (RG_PAGE): I2C page register
    - I2C access only
- I2C
  - Accessing different pages by setting up RG_PAGE
  - Default device number: 7'h60 (*If there are more than one hier, the device number of the second hier. will be 7'h61.)
  - Accessing different pages by setting up RG_PAGE (0xff)
  - Port 0 USB PHY register page : RG_PAGE value : 8'h00
  - Port 1 USB PHY register page : RG_PAGE value : 8'h01
  - Port 2 USB PHY register page : RG_PAGE value : 8'h02
  - Port 3 USB PHY register page : RG_PAGE value : 8'h03
  - Frequency Meter register page : RG_PAGE value : 8'h0f
- AHB
  - Accessing different pages by different base addresses
  - Supporting max. four ports. Base address: 800h,900h,a00h,b00h
    - Port 0 register base address: 800h
    - Port 1 register base address: 900h
    - Port 2 register base address: a00h
    - Port 3 register base address: b00h
    - Frequency meter registers base address: f00h

5.7 SPI Interface Controller

5.7.1 Introduction

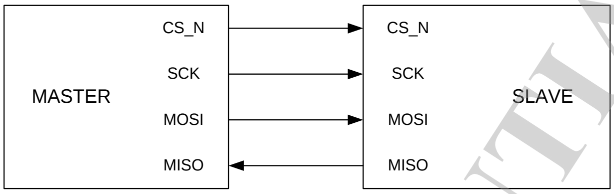

Figure 5-12. Pin connection between SPI master and SPI slave

The SPI interface is a bit-serial, four-pin transmission protocol. Figure 5-12 is an example of the connection between the SPI master and SPI slave. The SPI interface controller is a master responsible of the data transmission with the slave.

5.7.2 Pin Description

Table 5-3. SPI controller interface

Signal name	Type	Description
CS_N	O	Low active chip selection signal
SCK	O	The (bit) serial clock
MOSI	O	Data signal from master output to slave input
MISO	I	Data signal from slave output to master input

5.7.3 Transmission Formats

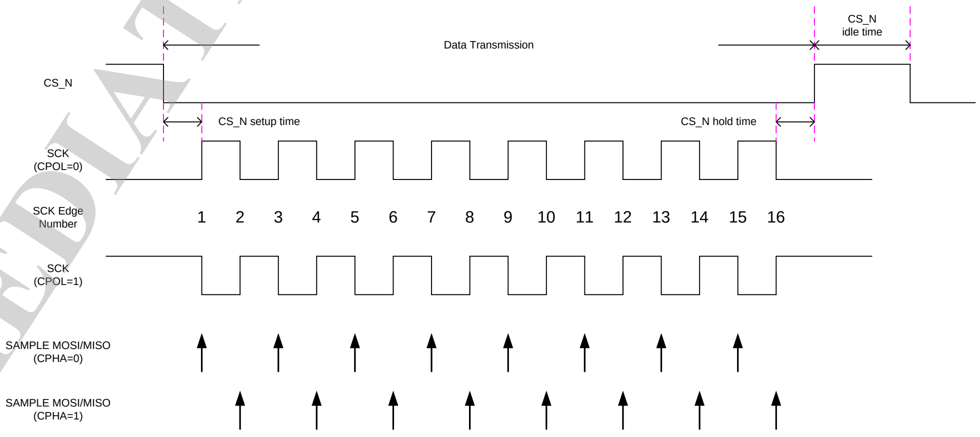

Figure 5-13. SPI transmission formats

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Figure 5-13 shows the waveform during the SPI transmission. The low active CS_N determines the start point and end point of one transaction. The CS_N setup time, hold time and idle time are also depicted.

CPOL defines the clock polarity in the transmission. Two types of polarity can be adopted, i.e. polarity 0 and polarity 1. Figure 5-13 is an example of both clock polarities (CPOL).

CPHA defines the legal timing to sample MOSI and MISO. Two different methods can be adopted.

5.7.4 Features

The features of the SPI controller (master) are:

- Configurable CS_N setup time, hold time and idle time
- Programmable SCK high time and low time
- Configurable transmitting and receiving bit order
- Two configurable modes for the source of the data to be transmitted. 1) In TX DMA mode, the SPI controller automatically fetches the transmitted data (to be put on the MOSI line) from memory; 2) In TX FIFO mode, the data to be transmitted on the MOSI line are written to FIFO before the start of the transaction.
- Two configurable modes for destination of the data to be received. 1) In RX DMA mode, the SPI controller automatically stores the received data (from MISO line) to memory; 2) In RX FIFO mode, the received data keep being in RX FIFO of the SPI controller. The processor must read back the data by itself.
- Adjustable endian order from/to memory system
- Programmable byte length for transmission
- Unlimited length for transmission. This is achieved by the operation of PAUSE mode. In PAUSE mode, the CS_N signal will keep being active (low) after the transmission. At this time, the SPI controller is in PAUSE_IDLE state, ready to receive the resume command. The state transition is shown in Figure 5-14.
- Configurable option to control CS_N de-assert between byte transfers. The controller supports a special transmission format called CS_N de-assert mode. Figure 5-15 illustrates the waveform in this transmission format.

Bit(s)	Mnemonic	Name	Description
	N		**DMA to memory** 0: Does not reverse (default)
13	**RXMSBF**	RXMSBF	**Indicates data received from MISO line is MSB first or not** Set RXMSBF to 1 for MSB first; otherwise set it to 0.
12	**TXMSBF**	TXMSBF	**Indicates data sent on MOSI line is MSB first or not** Set TXMSBF to 1 for MSB first; otherwise set it to 0.
11	**TX_DMA_EN**	TX_DMA_EN	**DMA mode enable bit of the data to be transmitted** 0: Not to enable (default)
10	**RX_DMA_EN**	RX_DMA_EN	**DMA mode enable bit of the data received** 0: Not to enable (default)
9	**CPOL**	CPOL	**Control bit of SCK polarity** 0: CPOL = 0 1: CPOL = 1
8	**CPHA**	CPHA	**Defines SPI Clock Format 0 or SPI Clock Format 1 during transmission** 0: CPHA = 0 1: CPHA = 1
7	**CS_POL**	CS_POL	**Control bit of chip select polarity** 0: Active low 1: Active high
6	**SAMPLE_SEL**	SAMPLE_SEL	**Control bit of sample edge of MISO** 0: Positive edge 1: Negative edge
5	**CS_DEASSERT_EN**	CS_DEASSERT_EN	**Enable bit of chip select de-assertion mode** Set to 1 to enable this mode.
4	**PAUSE_EN**	PAUSE_EN	**Enable bit of pause mode** Set to 1 to enable this mode.
2	**RST**	RST	**Software reset bit** When this bit is 1, software reset will be active high. Default: 0.
1	**RESUME**	RESUME	**Used when controller is in PAUSE IDLE state** Write 1 to this bit to trigger the SPI controller to resume transfer from PAUSE IDLE state.
0	**CMD_ACT**	CMD_ACT	**Command activate bit** Write 1 to this bit to trigger the SPI controller to start the transaction.

1100A01C <u>**SPI_STATUS0**</u> **SPI Status 0 Register** **00000000**

Bit(s)	Mnemonic	Name	Description
31:16	**SCK_LOW_COUNT**	SCK_LOW_COUNT	SCK clock low time = (SCK_LOW_COUNT + 1)*CLK_PERIOD
15:0	**SCK_HIGH_COUNT**	SCK_HIGH_COUNT	SCK clock high time = (SCK_HIGH_COUNT + 1)*CLK_PERIOD

5.7.7 Programming Guide

Follow the steps below to perform SPI transmission:

1. Prepare the data in the memory with its start address to be the "source address".
2. Set up the timing and protocol for the SPI transmission (see Figure 5-13 for detailed setup parameters).
3. Fill the "destination address", which is the start address that you would like to place the received data, and "source address", which is the start address to place the data to be transmitted, into register SPI_RX_DST and SPI_TX_SRC, respectively.
4. Write 1 the CMD_ACT to start the transfer
5. Get the data received from the buffer prepared starting from "destination address".

5.8 MSDC Controller

5.8.1 Introduction

The MSDC (Memory Stick and SD card Controller) fully supports

- SD memory card specification version 3.0
- SDIO card specification version 3.0
- MMC/eMMC 5.0

5.8.2 Features

Each MSDC contains:

- Interface with MCU by AHB bus
- 32-bit access on AHB bus
- 32-bit access for control registers
- 8-bit/16-bit/32-bit access for FIFO in PIO mode
- Built-in 128 bytes FIFO buffers for transmit and receive
- Built-in CRC circuit
- Basic DMA mode, basic descriptor mode, and enhanced descriptor mode for SD/MMC
- Interrupt capabilities
- Does not support SPI mode for SD/MMC memory card
- Does not support suspend/resume for SD/MMC memory card
- Supports SD3.0 SDR104, data rate up to 208x4Mbps
- Supports SD3.0 DDR50, data rate up to 50x4x2Mbps(4-bit with clock dual edge)
- Supports e-MMC boot-up mode
- 256 programmable serial clock rates on SD/MMC bus from 100kHz to 208MHz
- Card detection capabilities

MEDIATEK CONFIDENTIAL

5.8.3 Block Diagram

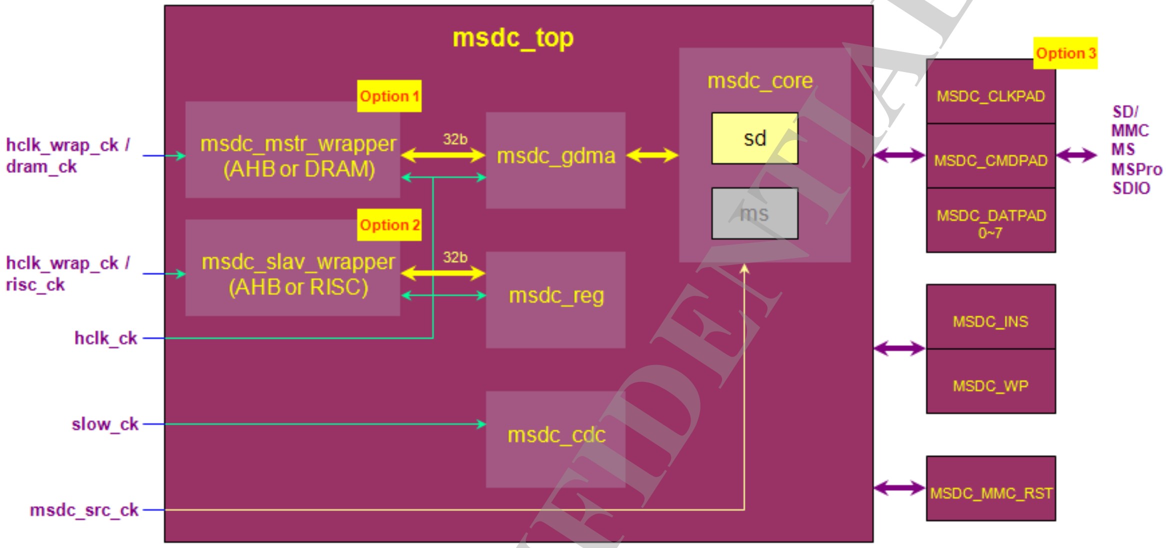

Figure 5-17. Block diagram of MSDC controller

5.8.4 Register Definition

MSDC number	Base address	Feature
MSDC0	0x11230000	EMMC4.5/5.0
MSDC1	0x11240000	SD3.0/SDIO3.0/EMMC4.5
MSDC2	0x11250000	SD3.0/SDIO3.0
MSDC3	0x11260000	SD3.0/SDIO3.0

There are 3 MSDC IPs in this SOC. Use of the registers below are the same except that the base address needs to be changed to respective one.

Module name: MSDC0 Base address: (+11230000h)

Address	Name	Width	Register Function
11230000	**MSDC_CFG**	32	**MSDC Configuration Register** For general configuration of the MS/SD controller
11230004	**MSDC_IOCON**	32	**MSDC IO Configuration Register** Contains the receiver path data latch timing control and interface control bits
11230008	**MSDC_PS**	32	**MSDC Pin Status Register** Stores card detection and write protection pin status. Card detection status can be disabled.
1123000C	**MSDC_INT**	32	**MSDC Interrupt Register** Contains the status of interrupts *Note: The register still shows the status of interrupt even though the interrupt is disabled.*
11230010	**MSDC_INTEN**	32	**MSDC Interrupt Enable Register**

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Address	Name	Width	Register Function
			Contains related enabling bit of interrupts
11230014	MSDC_FIFOCS	32	**MSDC FIFO Control and Status Register** Contains control and status of embedded 128B FIFO
11230018	MSDC_TXDATA	32	**MSDC TX Data Port Register** For PIO mode only. Used to input MSDC write data to card. The access can be AHB1B/2B/4B.
1123001C	MSDC_RXDATA	32	**MSDC RX Data Port Register** For PIO mode only. Used to read back MSDC read data from card. The access can be AHB1B/2B/4B.
11230030	SDC_CFG	32	**SD Configuration Register** Configures MS/SD memory card controller when it is configured as the host of SD memory card. If the controller is configured as the host of memory stick, the contents of the register will have no impact on the operation of the controller.
11230034	SDC_CMD	32	**SD Command Register** Defines a SD memory card command and its attributes. Before MS/SD controller issues a transaction onto SD bus, the application should specify other relative settings such as argument for command. After writing the register by the application, MS/SD controller will issue the corresponding transaction onto SD serial bus. If the command is GO_IDLE_STATE, the controller will have serial clock on SD/MMC bus running 128 cycles before issuing the command.
11230038	SDC_ARG	32	**SD Argument Register** Contains argument of SD/MMC memory card command
1123003C	SDC_STS	32	**SD Status Register** Reflects SD bus status and contains MMC stream write status
11230040	SDC_RESP0	32	**SD Response Register 0** Contains parts of the last SD/MMC memory card bus response. See description in register field SDC_RESP3.
11230044	SDC_RESP1	32	**SD Response Register 1** Contains parts of the last SD/MMC memory card bus response. See description in register field SDC_RESP3.
11230048	SDC_RESP2	32	**SD Response Register 2** Contains parts of the last SD/MMC memory card bus response. See description in register field SDC_RESP3.
1123004C	SDC_RESP3	32	**SD Response Register 3** Contains parts of the last SD/MMC memory card bus response. Register fields SDC_RESP0, SDC_RESP1, SDC_RESP2 and SDC_RESP3 are composed of the last SD/MMC memory card bus response. For response of type R2, i.e. response of the command ALL_SEND_CID, SEND_CSD and SEND_CID, only bit 127 to 0 of response token are stored in register field SDC_RESP0, SDC_RESP1, SDC_RESP2 and SDC_RESP3. SDC_RESP0 = bit 31~0 SDC_RESP1 = bit 63~32 SDC_RESP2 = bit 95~64 SDC_RESP3 = bit 127~96 For response of type R1b in auto CMD12 or R1 in auto CMD23, bit 39 to 8 of response token are stored in register field of SDC_RESP3. For the responses of other types, only bit 39 to 8 of response token are stored in the register field SDC_RESP0.
11230050	SDC_BLK_NUM	32	**SD Block Number Register** Defines block number for block transaction. For single read/write, this register should be set to 1. For multiple read/write, this register should be set to bigger than 1. Set to 0 will cause unexpected result.
11230054	SDC_VOL_CHG	32	**SD Voltage Change Wait Time Register** Defines SD voltage change check wait time.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Address	Name	Width	Register Function
11230058	SDC_CSTS	32	**SD Card Status Register** After commands with R1 and R1b response, this register will contain the status of the SD/MMC card.
1123005C	SDC_CSTS_EN	32	**SD Card Status Enable Register** Controls which bit of SDC_CSTS will generate the MSDC_INT.SD_CSTA interrupt
11230060	SDC_DATCRC_STS	32	**SD Card Data CRC Status Register** Reflects CRC status of data line[7:0]. Only for MSDC read.
11230070	EMMC_CFG0	32	**EMMC Configuration Register 0** For boot-up mode general configuration of e-MMC version 4.3 and 4.4
11230074	EMMC_CFG1	32	**EMMC Configuration Register 1** For boot-up mode general configuration of e-MMC version 4.3 and 4.4.
11230078	EMMC_STS	32	**EMMC Status Register** Reflects status of e-MMC boot-up mode operation
1123007C	EMMC_IOCON	32	**EMMC IO Control Register** Controls H/W reset pin of e-MMC boot-up mode operation
11230080	SD_ACMD_RESP	32	**SD ACMD Response Register** Stores response of auto command from SD card
11230084	SD_ACMD19_TRG	32	**SD ACMD19 Target Register** Selects target delay line to run ACMD19 sequence
11230088	SD_ACMD19_STS	32	**SD ACMD19 Status Register** Stores result of auto command 19 from SD card
1123008C	DMA_SA_HIGH4BIT	32	**DMA Current Address Register of High 4 Bits** Contains start address high 4 bits of the 36-bit address for 64G DRAM access
11230090	DMA_SA	32	**DMA Start Address Register** Contains start address of DMA descriptor
11230094	DMA_CA	32	**DMA Current Address Register** Contains current DMA address
11230098	DMA_CTRL	32	**DMA Control Register** Controls DMA operation
1123009C	DMA_CFG	32	**DMA Configuration Register** Configures DMA operation
112300A0	SW_DBG_SEL	32	**MSDC S/W Debug Selection Register** Selects SW debugging output
112300A4	SW_DBG_OUT	32	**MSDC S/W Debug Output Register** Shows selected debugging output
112300A8	DMA_LENGTH	32	**DMA Length Register** Sets up basic DMA operation length
112300B0	PATCH_BIT0	32	**MSDC Patch Bit Register 0** Configures patch function. For normal function, this bit should be kept at default value.
112300B4	PATCH_BIT1	32	**MSDC Patch Bit Register 1** Configures patch function. For normal function, this bit should be kept at default value.
112300B8	PATCH_BIT2	32	**MSDC Patch Bit Register 2** Configures patch function. For normal function, this bit should be kept at default value.
112300F0	PAD_TUNE0	32	**MSDC Pad Tuning Register 0** Configures delay line embedded in pad macro
112300F8	DAT_RD_DLY0	32	**MSDC Data Delay Line Register 0**

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Address	Name	Width	Register Function
			Configures delay line embedded in pad macro
112300FC	DAT_RD_DLY1	32	**MSDC Data Delay Line Register 1** Configures delay line embedded in pad macro
11230110	HW_DBG_SEL	32	**MSDC H/W Debug Selection Register** Selects HW debugging output
11230114	MAIN_VER	32	**MSDC Main Version Register** Version code of MSDC IP
11230118	ECO_VER	32	**MSDC ECO Version Register** ECO version code of MSDC IP
11230180	EMMC50_PAD_CTL0	32	**MSDC eMMC5.0 CLK Pad Control Register 0** Configures eMMC5.0 SD CLK pad for duty cycle corrector
11230184	EMMC50_PAD_DS_CTL0	32	**MSDC eMMC5.0 DS Pad Control Register 0** Configures eMMC5.0 SD DS pad
11230188	EMMC50_PAD_DS_TUNE	32	**MSDC eMMC5.0 DS Pad Tuning Register** Configures delay line embedded in DS pad macro
1123018C	EMMC50_PAD_CMD_TUNE	32	MSDC eMMC5.0 CMD Pad Tuning Register
11230190	EMMC50_PAD_DAT01_TUNE	32	MSDC eMMC5.0 DAT0/1 Pad Tuning Register
11230194	EMMC50_PAD_DAT23_TUNE	32	MSDC eMMC5.0 DAT2/3 Pad Tuning Register
11230198	EMMC50_PAD_DAT45_TUNE	32	MSDC eMMC5.0 DAT4/5 Pad Tuning Register
1123019C	EMMC50_PAD_DAT67_TUNE	32	MSDC eMMC5.0 DAT6/7 Pad Tuning Register
11230204	EMMC51_CFG0	32	**eMMC51 Configuration Register 0** Configures MS/SD memory card controller when it is configured as the host of SD memory card. If the controller is configured as the host of memory stick, the contents of the register will not affect the operation of the controller.
11230208	EMMC50_CFG0	32	**eMMC50 Configuration Register0** Configures MS/SD memory card controller when it is configured as the host of SD memory card. If the controller is configured as the host of memory stick, the contents of the register will not affect the operation of the controller.
1123020C	EMMC50_CFG1	32	**eMMC50 Configuration Register 1** Configures MS/SD memory card controller when it is configured as the host of SD memory card. If the controller is configured as the host of memory stick, the contents of the register will not affect the operation of the controller.
1123021C	EMMC50_CFG2	32	**AHB2AXI Wrapper Control Register** Sets up wrapper work mode
11230220	EMMC50_CFG3	32	
11230224	EMMC50_CFG4	32	
11230228	EMMC50_BLOCK_LENGTH	32

Reset	0	0	0	0	0	0	0	0	1	0	0	1	1	0	0	1

Bit(s)	Mnemonic	Name	Description
25	SCLKSTOPSEL	SCLK_STOP_SEL	**In DDR mode, stops SCLK when device is idle whether checking SCLK phase or not** 1'b0: Stop sclk not checking SCLK phase 1'b1: Stop sclk checking SCLK phase; fix 1/4T sclk glitch in DDR mode
24:23	START_BIT	START_BIT	
22	HS400CKMD	HS400_CK_MODE	**Selects HS400 clock mode**
21:20	CCKMD	CARD_CK_MODE	2'b00: Use clock divider output divided by msdc_src_ck as msdc_ck. Bit[15]~bit[8] should be programmed. 2'b01: Use msdc_src_ck as msdc_ck, bit[15]~bit[8] is ignored. 2'b10: DDR mode. Also use clock divider output divided by msdc_src_ck as msdc_ck. Bit[15]~bit[8] should be programmed. 2'b11: HS400 mode. Also use clock divider output and msdc_src_ck as msdc_ck. Bit[15]~bit[8] should be programmed.
19:8	CCKDIV	CARD_CK_DIV	**MS/SD card clock divider** Controls clock frequency of serial clock on MS/SD bus. Refer to "Data Line Latching Timing Diagram" and "Response Latching Timing Diagram". For non-DDR mode, msdc_ck equals SD bus clock. (Example: For SDR25 or HS, msdc_ck and SD bus clock will be 50MHz) For DDR mode, msdc_ck denotes MSDC internal clock which will be doubled to SD bus clock. (Example: For DDR50, msdc_ck should be set to 100MHz, and bus clock will be 50MHz.) 8'b00000000: msdc_ck = (1/2)*msdc_src_ck 8'b00000001: msdc_ck = [1/(4*1)]*msdc_src_ck 8'b00000010: msdc_ck = [1/(4*2)]*msdc_src_ck 8'b00000011: msdc_ck = [1/(4*3)]*msdc_src_ck 8'b00010000: msdc_ck = [1/(4*16)]*msdc_src_ck 8'b11111111: msdc_ck = [1/(4*255)]*msdc_src_ck
7	CCKSB	CARD_CK_STABLE	**MS/SD card clock is stable or not** After programming CARD_CK_MODE or CARD_CK_DIV, this bit will immediately become 0 and return to 1 if stable. Poll this register to ensure safety control of MSDC. 1'b0: Clock output is not stable. 1'b1: Clock output is stable.
6	BV18PSS	BV_1P8_PASS	**MSDC Bus voltage 1.8V detection status** S/W should check this bit after BUS_VOL_18V_START_DET turns to 0 from 1. 1'b0: Error in voltage detection 1'b1: No error in voltage detection
5	BV18SDT	BV_1P8_START_DET	**MSDC bus voltage 1.8V detection sequence start event** SW writes 1 to this bit to trigger HW outputting 1.8V clock for 1ms and automatically detecting CMD/DAT line sequence for voltage change is passed or not. HW will clear this bit to 0 after the detection is finished. The passed or failed status is stored in bit[6] BUS_VOL_18V_PASS.
4	CCKDRVE	CARD_CK_DRV_EN	**SD/MS card bus clock drive enable bit** Set this bit to 1 to enable MSDC bus clock driver. The default bus state depends on MSDC_CFG][1] CARD_CK_PWDN bit. If MSDC_CFG[1] CARD_CK_PWDN=1, the default clock state will

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
			be free running. If MSDC_CFG[1] CARD_CK_PWDN=0, the default clock state will be gated to 0. Set this bit to 0 will put the bus state into "tri-state". Default: 1 1'b0: Put the clock pad into tri-state 1'b1: Enable MSDC to drive clock pad. The state of CLK depends on MSDC_CFG[1] CARD_CK_PWDN.
3	**PIO**	PIO_MODE	**MS/SD PIO mode** Selects PIO mode. Default: PIO mode 1'b0: DMA mode 1'b1: PIO mode
2	**RST**	RST	**Software reset** Writing 1 to this register will cause internal synchronous reset of MS/SD controller, and it will not reset register settings and DMA controller. The reset sequence is done when this bit becomes 0. S/W should wait for this bit to return to 0 after writing 1. 1'b0: MS/SD controller is not in reset state. 1'b1: MS/SD controller is in reset state.
1	**CCKPD**	CARD_CK_PWDN	**MSDC bus clock power-down mode** Controls card clock power-down mode 1'b0: Clock is gated to 0 if no command or data is transmitted. 1'b1: Clock is free running even if no command or data is transmitted. (The clock may still be stopped when MSDC write data are not enough or no space for the next read data.)
0	**MSDC**	MSDC	**Selects MS/SD mode** Configures the controller to be the host of memory stick or host of SD/MMC memory card. The default value is configuring the controller as the host of memory stick. 1'b0: Configure controller to be host of memory stick 1'b1: Configure controller to be host of SD/MMC memory card

Bit(s)	Mnemonic	Name	Description
23	**AXIRSPERR**	AXI_RESP_ERR	**AXI BUS response error status**
19	**DMAPROTECT**	DMA_PROTECT	**There is write operation to DMA start address, length, start bit or last BUF bit.**
18	**GPDCSERR**	GPD_CS_ERR	**GPD checksum error detected**
17	**BDCSERR**	BD_CS_ERR	**BD checksum error detected**
16	**AC19DONE**	AUTOCMD19_DONE	**SD auto command 19 status register** When auto-command 19 is enabled, HW will clear this register to 0. As the tuning sequence is finished (32 times), this register will be set to 1 by HW. SW should check AUTOCMD_STS0 and SUTOCMD_STS1 only when this bit is on.
15	**SDDCRCERR**	SD_DATA_CRCERR	**SD data CRC error interrupt** Indicates that MS/SD controller detects a CRC error after reading a block of data from the DAT line or SD/MMC signals a CRC error after writing a block of data to the DAT line.

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
			1'b0: Otherwise 1'b1: MS/SD controller detects a CRC error after reading a block of data from the DAT line or SD/MMC signals a CRC error after writing a block of data to the DAT line.
14	**SDDTO**	SD_DATTO	**SD data timeout interrupt** Indicates SD/MMC controller detects a timeout condition while waiting for data token on the DAT line. This bit is for both data read and data write. For SD data read, timeout will occur when the read data are not presented. For SD data write, timeout will occur when the write data CRC status is not presented if PATCH_BIT[30] DETECT_WR_CRC_TIMEOUT = 1. 1'b0: Otherwise 1'b1: SD/MMC controller detects a timeout condition while waiting for data token on the DAT line.
13	**DMAXFDNE**	DMA_XFER_DONE	**DMA transfer done interrupt** Indicates status of data block transfer. 1'b0: Otherwise 1'b1: A data block is successfully transferred.
12	**SDXFCPL**	SD_XFER_COMPLETE	**SD data transfer completed interrupt** Indicates transaction which contains data that are completed. While performing tuning procedure (Execute Tuning is set to 1), SD_XFER_COMPLETE is not set to 1.
11	**SDCSTS**	SD_CSTS	**SD CSTA update interrupt** Indicates any bit in register SDC_CSTA is active. The register bit will be set to 1. SW should clear SDC_CSTA, and this bit will be de-asserted automatically. 1'b0: No SD memory card interrupt 1'b1: SD memory card interrupt exists.
10	**SDRCRCER**	SD_RESP_CRCERR	**SD command CRC error interrupt** Indicates SD/MMC controller detects a CRC error after reading a response from the CMD line. 1'b0: Otherwise 1'b1: SD/MMC controller detects a CRC error after reading a response from the CMD line.
9	**SDCTO**	SD_CMDTO	**SD command time-out interrupt** Indicates SD/MMC controller detects a time-out condition while waiting for a response on the CMD line. 1'b0: Otherwise 1'b1: SD/MMC controller detects a time-out condition while waiting for a response on the CMD line.
8	**SDCRDY**	SD_CMDRDY	**SD command ready interrupt** For the command without response, the register bit will be 1 once the command is completed on SD/MMC bus. For command with response without busy, the register bit will be 1 whenever the command is issued onto SD/MMC bus and its corresponding response is received without CRC error. For command with response with busy in DAT0, the register bit will be 1 whenever the command is issued onto SD/MMC bus and its corresponding response is received without CRC error and the DAT0 transited from busy to idle. 1'b0: Otherwise 1'b1: Command finished successfully without CRC error.
6	**DMAQEPTY**	DMA_Q_EMPTY	**DMA queue empty interrupt** Indicates the current DMA queue is empty. Only for descriptor mode and enhance mode.
5	**SDACDRC**	SD_AUTOCMD_R	**SD auto command CRC error interrupt**

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

Bit(s)	Mnemonic	Name	Description
	RCER	ESP_CRCERR	Set when detecting a CRC error in the auto command response.
4	SDACDCTO	SD_AUTOCMD_CMDTO	**SD auto command time-out interrupt** Set if no response is returned within a specified cycles (64T in spec) from the end bit of auto command.
3	SDACDCRDY	SD_AUTOCMD_CMDRDY	**SD auto command ready interrupt** Set if auto command is executed without CRC error or timeout.
1	MSDCCDSC	MSDC_CDSC	**MSDC card detection status change interrupt** Indicates if any interrupt for memory card insertion/removal exists. Whenever memory card is inserted or removed and card detection circuit is enabled, i.e. register bit CDEN in register MSDC_PS is set to 1, the register bit will be set to 1. It will be reset when the register is read. 1'b0: Otherwise 1'b1: Card is inserted or removed.
0	MMCIRQ	MMC_IRQ	**MMC card interrupt** 1'b0: Otherwise 1'b1: MMC card interrupt event occurs.

Name															ENWKUPINS	ENWKUPSDIOINT
Type															RW	RW
Reset															0	0

Bit(s)	Mnemonic	Name	Description
31:24	**DTOC**	DTOC	**Data timeout counter** The period from the end of the initial host read command or the last read data block in a multiple block read operation to the start bit of the next read data block requires at least two serial clock cycles. The counter is used to extend the period (Read Data Access Time) in unit of 1,048,576 serial clocks. 8'b00000000: Extend 1,048,576 more serial clock cycles 8'b00000001: Extend 1,048,576*2 more serial clock cycles 8'b00000010: Extend 1,048,576*3 more serial clock cycles 8'b11111111: Extend 1,048,576*256 more serial clock cycles
21	**INTBGP**	INT_AT_BLOCK_GAP	**Interrupt at block gap** This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Set to 1 will enable interrupt detection at the block gap for a multiple block transfer. Set to 0 will disable interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the host driver detects an SD card insertion, it will set up this bit according to CCCR of the SDIO card. 1'b0: Disable interrupt detection at block gap 1'b1: Enable interrupt detection at block gap
20	**SDIOIDE**	SDIO_INT_DET_EN	**Enables SDIO interrupt detection** Informs SD controller to sense SDIO interrupt. 1'b0: Disable SDIO interrupt detection 1'b1: Enable SDIO interrupt detection if SDIO bit is also on
19	**SDIO**	SDIO	**SDIO mode enable bit** Enables support to sense SDIO interrupt and disables R4 response CRC check for SDIO card. 1'b0: Disable SDIO mode 1'b1: Enable SDIO mode
17:16	**BUSWD**	BUSWIDTH	**Configures bus width** Defines SD/MMC bus width. 2'b00: 1-bit mode 2'b01: 4-bit mode 2'b10: 8-bit mode 2'b11: Reserved

11230034 SDC_CMD SD Command Register 00000000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name		VOLSWTH	ACMD		LEN											
Type		RW	RW		RW											
Reset		0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	GOIRQ	STOP	RW	DTYPE			RSPTYP			BREAK	CMD					
Type	RW	RW	RW	RW			RW			RW	RW					
Reset	0	0	0	0	0		0	0	0	0	0	0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
30	**VOLSWTH**	VOL_SWTH	**Voltage switch command** 1'b0: Disable voltage switch detection 1'b1: Enable voltage switch detection
29:28	**ACMD**	AUTO_CMD	**Enables auto command** Determines use of auto command functions. This function can be used in all modes including PIO/Basic DMA/Descriptor DMA/Enhanced Mode. There are two methods to stop multiple-block read and write operation. 1. Enabling auto CMD12 Multiple-block read and write commands for memory require CMD12 to stop the operation. When ACMD-12 is used, MSDC issues CMD12 automatically when the last block transfer is completed. Auto CMD12 error is indicated to the MSDC_INT register. The host driver shall not set up this bit if the command does not require CMD12. In particular, secure commands defined in the Part 3 File Security specification do not require CMD12. 2. Enabling auto CMD23 When ACMD-23 is used, MSDC issues a CMD23 automatically before issuing a command specified in the CMD field. The Host Controller Version 3.00 and later versions support this function. By writing the command register, MSDC issues a CMD23 first then a command specified by the CMD field in the SDC_CMD register. If response errors of CMD23 are detected, the second command will not be issued. A CMD23 error is indicated in the MSDC_INT register. 32-bit block count value for CMD23 is set to the SDC_BLOCK_NUM register. 2'b00: Disable auto command 2'b01: Enable auto CMD12 2'b10: Enable auto CMD23 2'b11: Enable re-tuning CMD19
27:16	**LEN**	LEN	**Length** Defines the length of one block (unit: byte) in a data transaction of block mode or the data length (unit: byte) in data transaction of byte mode. The maximum value of block length is 2,048 bytes. 12'b000000000000: Reserved

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.

Bit(s)	Mnemonic	Name	Description
			12'b000000000001: Block length is 1 byte. 12'b000000000010: Block length is 2 bytes. 12'b011111111111: Block length is 2,047 bytes. 12'b100000000000: Block length is 2,048 bytes.
15	**GOIRQ**	GO_IRQ	**GO_IRQ command** Indicates if the command is GO_IRQ_STATE (CMD40) and used only for MMC protocol. If the command is GO_IRQ_STATE, the period between command token and response token will not be limited. 1'b0: The command is not GO_IRQ_STATE. 1'b1: The command is GO_IRQ_STATE.
14	**STOP**	STOP	**Stop command** Indicates if the command is a stop transmission command. It should be set to 1 when CMD12 (SD/MMC) or CMD52 with I/O abort (SDIO) is to be issued. 1'b0: The command is not a stop transmission command. 1'b1: The command is a stop transmission command.
13	**RW**	RW	**Selects command read write** The register bit defines the command is a read command or write command. The register bit is valid only when the command causes a transaction with data token. 1'b0: The command is a read command. 1'b1: The command is a write command.
12:11	**DTYPE**	DTYPE	**Selects data block** Defines data token type for the command. 2'b00: No data token for the command 2'b01: Single block transaction (only available in block mode) 2'b10: Multiple block transaction. (only available in block mode) 2'b11: Stream operation. It should only be used in MMC protocol. (Only available in block mode)
9:7	**RSPTYP**	RSPTYP	**Command response type** 3'b000: This command has no response. 3'b001: The command has R1/R5/R6/R7 response. The response token is 48-bit with CRC check (for SD/MMC/SDIO) (not including the SDIO abort command). 3'b010: The command has R2 response. The response token is 136-bit (for SD/MMC). 3'b011: The command has R3 response. The response token is 48-bit response, no CRC check (for SD/MMC). 3'b100: The command has R4 response. The response token is 48-bit without CRC check (for SDIO). The response token is 48-bit with CRC check (for MMC). 3'b111: The command has R1b response. The response token is 48-bit (for SD/MMC/SDIO).
6	**BREAK**	BREAK	**Aborts pending MMC GO_IRQ command** Only valid for a pending GO_IRQ_MODE command waiting for MMC interrupt response. 1'b0: Not a beak command 1'b1: Break a pending MMC GO_IRQ_MODE command in the controller
5:0	**CMD**	CMD	**SD memory card command**

Bit(s)	Mnemonic	Name	Description
31	**MMCSWRCPL**	MMC_STREAM_WR_COMPL	**MMC stream mode write data are all flushed to MMC card.** SW can use this bit to confirm the last write data are flushed to MMC before issuing the STOP command. This bit is only valid when command SDC_CMD.DTYPE=2'b11. 1'b0: Last data are partially inside MSDC. 1'b1: Last data are flushed to MMC card.
16		CMD_WR_BUSY	
1	**CMDBSY**	CMDBUSY	**SD command line busy status** SW should always read this bit to make sure the command line is not busy before sending the next command. If the command is R1B or data read/write command, SW should also check the SDCBUSY bit. *Note: When auto command 12 is enabled, this bit will be asserted immediately after SDC_CMD is written and de-asserted after auto-command 12 is finished.* 1'b0: No transmission is going on CMD line on SD bus 1'b1: There exists transmission going on CMD line on SD bus
0	**SDCBSY**	SDCBUSY	**SD controller busy status** 1'b0: SD controller is idle. 1'b1: SD controller is busy.

Reset	0	0	0	0	0	0	0	0	0	0			1	1	1	1

Bit(s)	Mnemonic	Name	Description
31	**PTCH31**	EN_MMC_DRV_RESP	**Enables MSDC always driving bus when outputting wake-up response (BREAK)** 1'b0: Disable 1'b1: Enable
30	**PTCH30**	DETECT_WR_CRC_TIMEOUT	**Detects MSDC write data CRC phase time-out** 1'b0: Does not detect CRC phase timeout 1'b1: Detect CRC phase timeout
29	**PTCH29**	SPC_ALWAYS_PUSH	**SPC buffer push mechanism** 1'b0: Push the buffer only when read transfer is on-going 1'b1: Always push the buffer
28	**PTCH28**	SDIO_INT_DLY_SEL	**Selects SDIO interrupt latch time** 1'b0: Latch the data line value in internal SDIO interrupt period 1'b1: Latch the data line value in 1 clock delay of internal SDIO interrupt period
27	**PTCH27**	SDC_CMD_CMDFAIL_SEL	**Selects SDIO interrupt period recovery** 1'b0: SDIO interrupt period will re-start after a CMD12 or CMD52 command is issued 1'b1: SDIO interrupt period whenever DAT line is not busy
26	**PTCH26**	SDC_CMD_IDRT_SEL	**Selects SD identification response time** The register bit indicates if the command has a response with NID (i.e. 5 serial clock cycles as defined in SD memory card Specification Part 1 Physical Layer Specification version 1.0) response time. The register bit is valid only when the command has a response token. Thus, the register bit must be set to 1 for CMD2 (ALL_SEND_CID) and ACMD41 (SD_APP_OP_CMD). 1'b0: Otherwise 1'b1: The command has a response with NID response time.
25:22	**PTCH22**	SDC_CFG_WDOD	**SD write data output delay** The period from finish of the response for the initial host write command or the last write data block in a multiple block write operation to the start bit of the next write data block requires at least two serial clock cycles. The register field is used to extend the period (Write Data Output Delay) in unit of one serial clock. 4'b0000: No extension 4'b0001: Extend 1 more serial clock cycle 4'b0010: Extend 2 more serial clock cycles 4'b1111: Extend 15 more serial clock cycles

MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Bit(s)	Mnemonic	Name	Description
21:18	**PTCH18**	SDC_CFG_BSYDLY	**SD R1B busy detection mode** Only valid for the commands with R1b response. If the command has a response of R1b type, MS/SD controller must monitor the data line 0 for card busy status from the bit time that is two serial clock cycles after the command end bit to check if operations in SD/MMC memory card are finished. The register field is used to expand the time between the command end bit and end of detection period to detect card busy status. If time is up and there is no card busy status on data line 0, the controller will abandon the detection. 4'b0000: No extension 4'b0001: Extend 1 more serial clock cycle 4'b0010: Extend 2 more serial clock cycles 4'b1111: Extend 15 more serial clock cycles
17	**PTCH17**	SDIO_CFG_INTC_SEL	**Selects SDIO interrupt model** 1'b0: When data line [1] = 0, trigger SDIO interrupt event. 1'b1: When data line [3:0] = 4'b1101, trigger SDIO interrupt event
16	**PTCH16**	MSDC_BLKNUM_SEL	**Supports ACMD23 reliable/force pro etc. features** 1'b0: Support ACMD23 reliable/force prog etc. feature 1'b1: Does not support ACMD23 reliable/force prog etc. feature
15	**PTCH15**	MSDC_FIFO_RD_DIS	**Disables MSDC RXFIFO read** 1'b0: Disable FIFO read permission to RXFIFO in PIO mode 1'b1: Enable FIFO read permission to RXFIFO in PIO mode
14:10	**CKGDLYS**	CKGEN_MSDC_DLY_SEL	**Selects CKBUF in CKGEN delay** Total 32 stages.
9:7	**INTCKS**	INT_DAT_LATCH_CK_SEL	**Selects internal MSDC clock phase** Total 8 stages, each stage can delay 1 clock period of msdc_src_ck.
6	**DESCUP**	DESC_UP_SEL	**SD transfer done interrupt should be issued when GPD are updated.** 1'b1: Enable new function to generate SD transfer done interrupt 1'b0: Use old function to generate SD transfer done interrupt
3	**PTCH03**	DIS_REFLECT	**Enables SD command register write monitor** 1'b0: Enable monitor function 1'b1: Disable monitor function
2	**PTCH02**	DIS_REFLECT_CMDWR_WHEN_BSY	**Enables SD command register write monitor** 1'b0: Enable monitor function 1'b1: Disable monitor function
1	**PTCH01**	EN_SDC_ODD_8BIT_SUP	**Enables SD odd number support for 8-bit data bus** 1'b0: Disable 1'b1: Enable
0	**PTCH00**	EN_SDC_ODD	**Enables SD odd number support for 8-bit data bus** 1'b0: Disable 1'b1: Enable

Bit(s)	Mnemonic	Name	Description
3:2	**RESPWAITCNT**	RESP_WAIT_CNT	**Configures CMD response timeout** The timeout cycle is 65T+16*RESP_WAIT_CNT. 2'b00: CMD response timeout is 65T. 2'b01: CMD response timeout is 65T+ 16*1T. 2'b01: CMD response timeout is 65T+ 16*2T. 2'b01: CMD response timeout is 65T+ 16*3T.
1	**SUPPORT64G**	SUPPORT_64G	**Indicates which project supports high 64G DRAM space access** 1'b1: Support 64G DRAM access 1'b0: Does not support 64G DRAM access
0	**ENHANCEGPD**	ENHANCE_WAIT_GPD	**If SW clears int when GPD update has not been finished, the design will hang.** Set this bt to 1 to avoid such iuuse in enhance write mode. 1'b1: Use new HW code to update GPD in enhance mode 1'b0: Use old HW code

112300F0 **PAD_TUNE0** **MSDC Pad Tuning Register 0** **00000000**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Name	CLKTDLY					CMDRRDLY						CMDRDLY				
Type	RW					RW						RW

Type				RW					RW			RW				
Reset				0	0	0	0	0	0			0	0	0	0	0

Bit(s)	Mnemonic	Name	Description
31:27	**CLKTDLY**	PAD_CLK_TXDLY	**Controls CLK pad TX delay** This register adds delay to CLK phase. Total 32 stages.
26:22	**CMDRRDLY**	PAD_CMD_RESP_RXDLY	**Controls CMD response internal delay line** This register fine-tunes response phase latched by MSDC internal clock. Total 32 stages.
20:16	**CMDRDLY**	PAD_CMD_RXDLY	**Controls CMD pad RX delay line** This register fine-tunes CMD pad macro response latch timing. Total 32 stages.
12:8	**DATRRDLY**	PAD_DAT_RD_RXDLY	**Controls DAT pad RX delay line (for MSDC read only)** This register fine-tunes DAT pad macro read data latch timing. Total 32 stages.
7	**DELAYEN**	DELAY_EN	**Enables all delay cell toggle when power is on** 1'b0: Disable delay cell toggle default 1'b1: Enable delay cell toggle default
4:0	**DATWRDLY**	PAD_DAT_WR_RXDLY	**Controls write data status internal delay line** This register fine-tunes write status phase latched by MSDC internal clock. Total 32 stages.

112300F8 **DAT_RD_DLY0** **MSDC Data Delay Line Register 0** **00000000**
